ABSTRACT

Twelve monthly issues of this magazine for parents and others concerned with children with disabilities are contained in this document. Individual issues typically include a number of articles based on the issue's theme, a special report, research reflections, and regular columns covering news items, practical answers to child rearing problems, book reviews, a legislative update, new products, and a children's page. A continuing series addresses the oral health of people with disabilities. Individual issues address the following themes: (1) organizational and agency resources; (2) early childhood; (3) life planning; (4) medical research; (5) transitioning; (6) technology; (7) teenagers and young adults; (8) infant health and development; (9) education; (10) toys; (11) stress management; and (12) family and community. Other topics highlighted in various issues include autism and the measles/mumps/rubella vaccine, making summer plans, mobility, the treatment of childhood movement disorders, research on traumatic brain injury, adaptive track and field, military special programs, empowering parents, a listing of schools and camps, and assistance dogs. What's a life worth?

Ask someone with a rare disease.

Drugs that treat rare diseases affecting less than 200,000 Americans are defined by Congress as orphan drugs. Orphan drugs generally aren't highly profitable. Most are a break-even business opportunity at best. Their discovery, in most cases, won't cause stock prices to skyrocket. But orphan drugs do save lives and improve the lives of people with these rare conditions. They can make life worth living for people with diseases few people recognize.

At Sigma-Tau Pharmaceuticals, we believe that quality of life is precious and no patient should be overlooked, no matter how rare the illness. We research and produce orphan drugs and devote 20 percent of our revenue to clinical research for inborn metabolic diseases and dialysis – a rate that exceeds the industry average. Sigma-Tau is the worldwide leader in carnitine and metabolic research.

What's a life worth? To people with a rare disease, a healthy life is priceless.

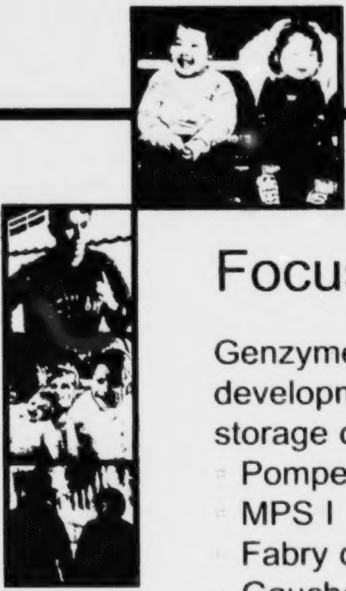
a rare kind of care



Focused Research

Genzyme is committed to the research and development of therapies for lysosomal storage disorders including:

- Pompe disease
- MPS I
- Fabry disease
- Gaucher disease
- Niemann-Pick disease type B

Unparalleled Support

Genzyme offers comprehensive resources for patients and those who care for them.

- Insurance support
- Disease education and training
- Disease registries
- Medical assistance and advice
- Access to free diagnostic screening
- Genetic Leadership Collaborative

IT'S A RARE KIND OF CARE.

There's no place like home.™

Living at home is the ultimate goal for many with chronic illness or disability. Frequent respiratory complications may make this goal seem impossible. The Vest™ Airway Clearance System has made the difference for Zack. He's now enjoying childhood at home with his family. And as they say, "There's no place like home."

Zack, The Vest™ system user since 1997

More than 2,400 physicians have prescribed The Vest™ system for 20,000 patients with respiratory complications associated with more than 280 diseases and conditions.

The Vest™ system is:
- Widely accepted
- Evidence-based
- Easy to use
  - All lobes of the lungs treated simultaneously
  - Positioning not required
  - Breathing techniques not required
  - Aerosolized treatments can be delivered simultaneously
- Suitable for home and hospital use
- Patient training provided

For more information about The Vest™ Airway Clearance System, call us at 1-866-411-VEST or visit www.thevest.com.

AN EXTRAORDINARY PROMISE — AN ORDINARY LIFE

If you or someone you love has had their life turned upside down by epilepsy, an everyday, ordinary life can be the most extraordinary promise of all.

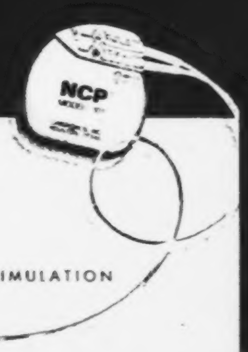
So if you're dissatisfied with the quality of life and seizure control you've had from anti-seizure medications, or you've found their side effects intolerable, discover the difference that VNS Therapy™ can make.

VNS Therapy has been used by over 15,000 patients like Brady with refractory epilepsy that hasn't responded to multiple medication regimens.

If at least two anti-seizure medications haven't worked, ask your doctor about adding VNS Therapy. It's not brain surgery. It's a medical device the doctor implants in the chest, with leads that run up to the vagus nerve in the neck.

It provides significant seizure control for many patients, with no debilitating side effects, and improvement in alertness, fatigue and mood. Some patients are even helped as dramatically as Brady, although VNS results may vary.

BEST COPY AVAILABLE



VNS Therapy is indicated for use as an adjunctive therapy in reducing the frequency of seizures in adults and adolescents over 12 years of age with partial onset seizures that are refractory to antiepileptic medications. See your Neurologist or Surgeon for all reported and potential side effects, warnings, precautions, and contraindications related to VNS.

Do something extraordinary today. Ask your doctor if VNS Therapy is right for you. Call us at **1-866-281-4686**. And visit our Web site at www.cyberonics.com. Your whole life is waiting.

JANUARY 2002 ◦ VOLUME 32, ISSUE 1

RESOURCE GUIDE 2002

KNOWLEDGE IS POWER: It is ironic that the brain and its frailties are responsible for the majority of the genetic or acquired disabilities that EP addresses every month. However, the human brain is also a vast resource storehouse and is capable of forming neural networks which serve to transmit sensory information. The 2002 EP Resource Guide may be thought of as a printed repository of thousands of resources that can help users grow in knowledge to find new networks and pathways in advocating and caring for someone with any disability. That knowledge gives power to those who are trying to make life with a disability more livable.

This year, to make the Resource Guide more user-friendly, we have fashioned descriptions of each directory to anticipate questions which may arise for parents and professionals in their search for particular information. We have highlighted in bold some of the key phrases that may spark a connection. The editors at EP express their special thanks to Betsy Santelli the director of the Parent to Parent projects of the Beach Center on Families and Disability at the University of Kansas for compiling these "frequently asked questions."

And as always, we heartily thank all the organizations and associations for contributing their directories and being a part of this issue. Thanks, too, to EP staffers Kendra Kelly and Dolores Kinley for the cover selection. The EP staff wish everyone a great new year and "More Power to You!"

Does your family member have a **specific disability diagnosis** or **specific symptoms of a disability** for which you would like more information? Do you want to **connect to a group** of people coping with similar challenges who can direct you to **local resources** for that specific disability in your area?
See the **National Resources for Specific Disabilities** followed by **Matching Resources** **22**

Would you like to be matched one-to-one with another parent whose family and disability experiences are similar to your own? Would you like to receive **information and emotional support from other parents** who have "been there"?
See the **Parent to Parent Programs** **54**

Are you looking for information about how to meet the **educational needs** of students with disabilities—from infant to young adult —and their families?
See the **Parent Training and Information Centers** around the country are there to help parents and professionals **58**

Are you looking for services in your area to enable your family member with developmental disabilities **to participate in the community**? Interested in learning more about research and best practices for serving people with disabilities and their families?
See the **Association of University Centers on Disabilities** **66**

ERIC Clearinghouse on Disabilities and Gifted Education
Arlington, VA 22201-5704

contents

Do you need **adapted equipment or technology** for a family member with special needs or information about funding to pay for assistive technology devices?
See the **Alliance for Technology Access Centers** directory **69**
See the **State Assistive Technology Programs** directory **71**

Would you like to know how your family member with special needs can **participate in sports or recreational activities?**
See the directory of **Adaptive Recreation Organizations** **80**

Are you looking for a hospital in your area that **specializes in treating children** and specialty disorders?
See the NACHRI's **Children's Hospitals** directory of member hospitals including some which do not bill for services **82**

Need **health-related services** for a child with special health care needs, parent support or information?
See the state program's listing in the **Title V** directory **85**

Looking for information, technical assistance, or training on **meeting Americans with Disabilities Act standards** in a business, public area, or school?
Try your regional center in the **ADA Projects** directory **87**

Do you have an infant or toddler (birth to three) with special needs and need information and services—from **preschool education to therapies**—for that child?
The **Early Intervention** directory lists your state's program **94**

Information about a variety of disability-related topics—from specific disorders to employment—is available from the Federal government.
See the **Federal and Federally Funded Information Resources** **100**

Need information or services that are related to **many areas of living with a disability** including accessible travel, independent living, caregiving, respite, adoption, and adaptive toys?
Try the **National Information and Advocacy Resources** **102**

Do you need information on a disorder that affects **movement?**
Turn to the **International Guide to Movement Disorder Patient Advocacy Groups and Foundations** from WE MOVE **108**

Do you have concerns about the whether your child's **rights to special education services** are being properly respected? Do you need referral to **local resources?**
See the **State Directors of Special Education** for your state's agency which oversees special education services **116**

Are you looking for information and local resources available to meet the **healthcare** needs of children with disabilities and chronic illness in your area? Do you want to work with others to **influence healthcare policies?**
See the **Family Voices State Contact** list for your state's coordinator **123**

Do you need help advocating for the **legal rights** of your family memberwith a disability?
Look at the **State Protection and Advocacy Agencies for Persons with Developmental Disabilities, Mental Illness and the Client Assistance Program (P&A)** for your state's programs **127**

Need information and support for caring for a family member who has **challenging behaviors, emotional disabilities or mental health issues?**
See the directory of organizations that form the **Federation of Families for Children's Mental Health** **152**

Do you have a young adult with a disability who is entering the world of **employment** or is already employed? Would you like to know more about **training and rehabilitation services** that are available in your state?
See the directory of **Vocational Rehabilitation Programs** **157**

What **issues** did EP cover in 2001?

biological Solutions
approach to
logical research

by fostering partnerships among leading neuroscientists that deliver measurable improvements in the lives of brain injured children, and their families. The outcome of this research and education will provide proven treatments and integrated therapies with easily obtainable information, broadly accessible to those in need, assisting informed decision making.

MISSION STATEMENT: Children's Neurobiological Solutions, Inc. (CNS) is a national, non-profit, 501(c)(3) organization, whose mission is to orchestrate cutting-edge, collaborative research with the goal of expediting the creation of effective treatments and therapies for children with neurodevelopmental abnormalities, birth injuries to the nervous system, and related neurological problems. In addition, CNS strives to provide families and health care providers with user-friendly access to state-of-the-art information and education supporting their decision-making processes.

Kelly's Random Acts of Kindness Cart

RICK RADER, MD

Physicians are faced with ever-increasing clinical challenges: the emergence of resistant strains of bacteria, clinical decisions being second-guessed by MCO clerks, evidence-based murkiness, and diminishing societal significance. These professional hazards have somehow escaped from doctors' locker rooms and manifested themselves in a drop-off in the number of applicants to medical schools. While these problems are significant, they pale by comparison to the most challenging dilemma facing physicians today: what to do with all the drug company giveaways we bring back from national medical conferences.

This essay doesn't address the promotional extravaganza of bringing a blockbuster drug to market–it's not that cerebral. Instead, it's about recycling stuff and creating something worthwhile from it. And because it's the editorial that appears in EP's 2002 Resource Guide, it's about resources.

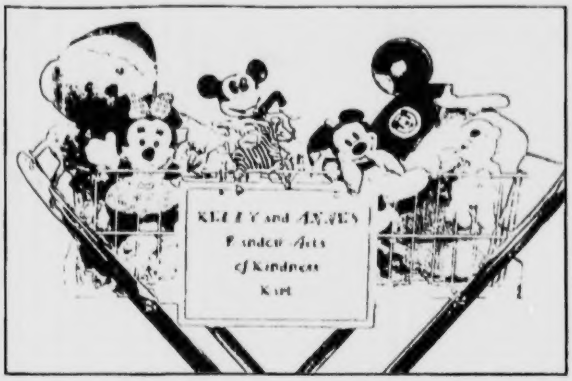
Susan, my assistant, shudders on those Monday mornings when I stroll back into the office overloaded with blue canvas tote bags announcing the next generation of some boutique drug. She shudders because the bags contain not only reports and monographs that translate into weeks of follow-up correspondence, phone calls and new projects, but the mother lode. Out spill pens, note pads, desk toys, small stuffed animals, gadgets, whiz bangs, T-shirts, stethoscope-hugging creatures and every object imaginable that has a surface big enough to display the logo of Intergalactic Drug Co, Ltd. I'm a pack rat, I can't resist this stuff; besides, it's too unwieldy to pack all those steaks and bagels from the focus group dinners and breakfasts. And so I bear gifts.

One afternoon when Susan was taking some college students on a tour of the Habilitation Center, I ventured into her storage closet to find some archival files. It looked like the back room of Toys "R" Us, or as if the elves were working overtime in mid-December. Stuff was overwhelming; it lay on shelves, computer boxes and counter tops, and filled drawers, shopping bags, even mail carts. Two things were certain: I had schlepped my last satchel of nasal congestant boasting finger puppets, and it all had to go. But it couldn't be thrown out; such waste bordered on sacrilege. It had to be moved out but not thrown out, sorta like good ideas before their time.

A few days later Kelly navigates herself into my office. Miss Kelly Bankston is a student at Orange Grove school, a charismatic, delightfully manipulative, never-to-be-forgotten femme fatale. We've become partners in crime. I first "used" Kelly while creating an innovative program several years ago; she was a surrogate patient in a Grand Rounds presentation introducing medical residents and students to the challenges of developmental medicine. It put us both on the cover of EXCEPTIONAL PARENT MAGAZINE and she's been "using" me ever since, mainly as a destination when she goes on excursions throughout the Center. We engage in a wonderful ritual: Kelly comes into my office and asks me if I would call her the next day at home. I nod, and she pantomimes writing; this prompts me to fetch a legal pad and a pen. Then she maneuvers her chair right up to my desk and proceeds to write down her telephone number and name. For a young woman with CP, multiple shunt revisions and enough orthopedic anomalies to give a team of osteoanthropologists a field day, this is no small feat. Several years and several thousand hours of tedious and diligent instruction by her teacher Jenny Chase—rivaled only by the diligent granite chiseling that created Mount Rushmore—resulted in a new skill. Kelly's legible writing is presidential. It's an accomplishment to equal "genius [as] an African who dreams up snow," an observation by Nabokov. For Kelly and Jenny to have dreamed up a strategy to produce a legible scrawl is indeed an amalgam of genius and talent.

Back to Kelly wandering into my office for the ceremonial offering of her phone number. Somehow I get an idea: in addition to stopping in at my office during one of her daily cruises around the Center, maybe Kelly could stop at a few other places. There are lots of destinations at Orange Grove, lots of classrooms, clinics, offices, reception desks, therapy centers, gyms, record rooms and cafeterias, and lots of folks in them, too. I envision Kelly dropping off one of the goodies from Susan's closet at each des-

photos by Dennis Wilkes



tination, for no reason at all.

So we commandeered a mail cart, made some cool signs for the sides of the basket, recruited Anne Patten of the Habilitation Center to assist Kelly, loaded the cart, made a chart and pointed Kelly in the direction of her waiting public. The cart was christened "Kelly and Anne's Random Acts of Kindness Cart," and launched to applause. Kelly didn't need mentoring or tutorials on being nice or engaging or fostering social affiliations any more than a goose needs a GPS. To date, Kelly and Anne have made dozens of sorties throughout Orange Grove and given away enough drug company goodies to put a major dent in the inventory.

Sure, we can translate this newly created "activity " into IEPese: "Kelly will personally deliver small inexpensive donated gifts to staff and students, reap the benefits of social initiation and engagement, and experience the various ways in which people will respond to her." Throw in the "promise " of collecting and recording data and you have the makings of a bonafide educational objective, and we did. But at the end of the day it's just Kelly giving out stuff for no real reason except that she likes to, and that's reason enough for me to keep stocking the closet.

It's a natural equation for success: juxtapose untapped human resources with an overflowing closet clamoring for resource depletion, and you can come up with something– well, something exceptional.

Resources are what EP is all about, and this guide is the best compendium for schools, camps, clinics, therapeutics, products, technology, organizations and people ever assembled. Use it and you just might experience some random acts of kindness yourself.

Rick Rader, MD

Editor-in-Chief
Director, Morton J. Kent Habilitation Center
Orange Grove Center, Chattanooga, TN

THE CENTER FOR CHILDREN • HOSPITAL FOR JOINT DISEASES

Caring for children with
Cerebral Palsy
requires the help of many specialists.

Now you can find them all at
one special place.

The Center for Children is the one place you'll find all the care options you need, with just one concern in mind: your child. By bringing together the resources of the Hospital for Joint Diseases (HJD) and the Rusk Institute of Rehabilitation Medicine (RIRM) of NYU Hospitals Center, we can care for a variety of conditions in one convenient setting. For example, you'll find the widest possible range of treatments for children with cerebral palsy, with in-house specialties including pediatric physiatry, orthopaedics, speech therapy, neurology, neurosurgery, physical and occupational therapy. All in a gentle, kid-friendly environment where there are no white coats, but plenty of color, interaction, toys, games and stimulation. From newborns to 21-year-olds, The Center for Children treats them better. **Call us at 212-598-2330.**

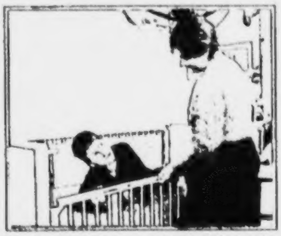
HARD MANUFACTURING

AGE APPROPRIATE BEDS

For when your child passes the crib stage!

Dianna Fitzgerald
& Her Son Nicholas



The Stockton features full crib safety sides

Beds for children once they pass the crib stage are always an issue with parents... I can't begin to tell you how terrific the people at HARD Mfg. are. Mary Bias, the rep for the Indiana area told me she knew exactly what I wanted and needed for Nicholas. Thirty-days later the Stockton Bed arrived and it couldn't be more perfect! The Stockton comes in three sizes, with crib type rails, and a height adjustment up to 34"... saving my back! It even has a mounted IV pole for Nicholas' feeding pump. Mary had also suggested the white bed with a red outer footboard and yellow inner headboard...

It truly is the best investment we ever made.

Thank You HARD!
Dianna Fitzgerald

- HARD "Age Appropriate" Beds accommodate your child with the safety and convenience you would expect from the nation's #1 manufacturer of hospital cribs and youth beds.
- Available in a rainbow of colorful epoxy finishes and laminate colors to match your room decor.
- Hi-Lo adjustment for convenience and safety.
- Attains all orthopedic and comfort positions.
- Currently available in custom sizes to accommodate all ages.
- Crib type safety sides are close to the mattress to protect arms & legs.

For information about our full line of beds and cribs,
as well as locating your nearest HARD dealer, please give me a call.

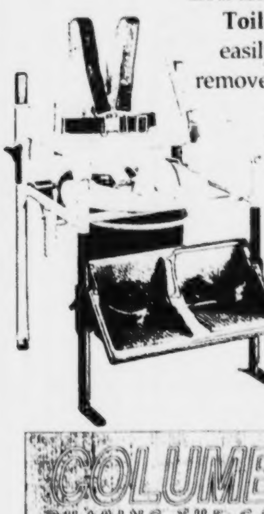
Sally, 40 lbs. and 45" tall, in the #8600 Reclining Bath Chair with #8875 Head Pad

Sharing the Caring

Columbia offers you solutions to the daily challenges of bathing, toileting and transporting your child - *with comfort, safety and ease!*

You and your child face some tough challenges, but you're the one who must solve them in the most practical ways. Here's how we can help:

☐ At toileting time, our **Toilet Supports** fit easily onto any toilet; remove easily, too. And our **Positioning Commodes** give the same toileting support in any location.



#5800 Hi-Back Positioning Commode for junior adults

☐ At bathtime, our popular **Wrap-Around Bath Supports** and **Reclining Chairs** allow your child - and you - to enjoy the bath.

#7200 Wrap-Around Support

#8600 Medium Recliner for a child 40"-54" tall, up to 130 lbs.

☐ When your child has outgrown that infant car seat, you can have peace of mind knowing that the **Columbia Car Seat** has been crash tested for children from 20 to 102 lbs.-yet weighs only 11 pounds! Comfort, style and adjustability have made it the No. 1 choice since 1986.

#2000 Car Seat

Why do these products work so well?
Much thought and care go into the design of each Columbia product. We make each item in the **right size for your child**, with lots of adjustability for a custom fit. They are made of durable materials, proven in real life. Made in the USA and sold all over the world, Columbia products are leaders in *all* their categories.

Get all the details from our FREE full color catalog. "Sharing the Caring" means *products that work!*

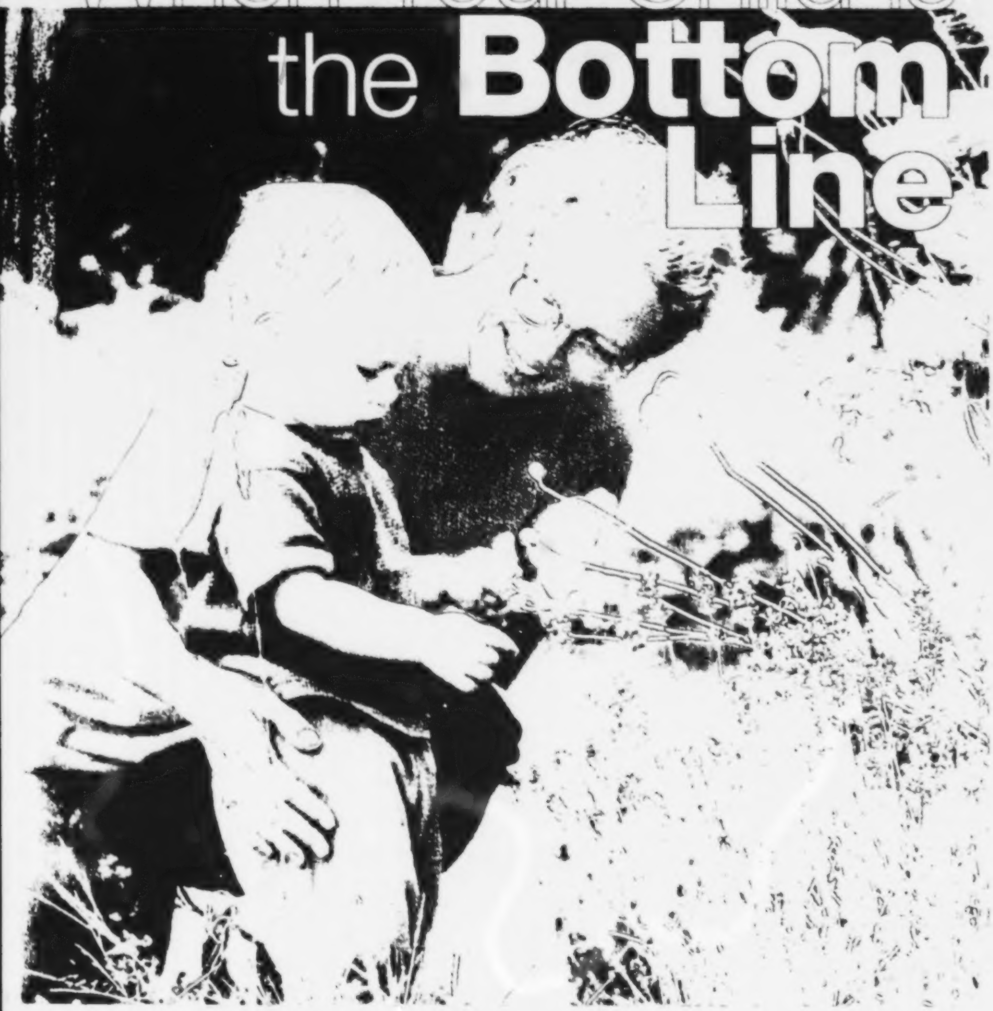
When Your Child is the Bottom Line



Athena Diagnostics — The most advanced line of Neurological Diagnostic Testing available today:

- ○ *Infant Hearing Loss*
- ○ *Charcot-Marie-Tooth Disease*
- ○ *Neuromuscular Disorders*
- ○ *Developmental Delay*
- ○ *Spinocerebellar Ataxia*
- ○ *Dystonia*

Better Diagnosis for **Better Care**

At Athena Diagnostics, providing the tools your doctor needs to make critical care management decisions is what we are all about.

We've developed the most **comprehensive neurological testing services** and set the standard for the diagnosis of your child.

Making informed decisions has never been easier with a series of advanced diagnostic tests developed in conjunction with leading medical research institutions around the world. With a broader range of information available, you and your doctor will make better decisions regarding your child's care.

Ask your doctor how a diagnostic test from Athena can help you and your child.

For more information, visit our web site at **www.athenadiagnostics.com/parent.**

NATIONAL RESOURCES FOR SPECIFIC DISABILITIES

This directory includes national groups and organizations that can serve as resources for parents and professionals seeking information and support regarding specific disabilities and conditions. Please note that information on some specific disabilities may also be available from Federal and Federally-Funded Information Resources, Parent to Parent Programs, or certain National Information and Advocacy Resources (see Table of Contents for page numbers). In addition, Matching Resources, at the end of this directory, may also be useful.

CROSS-REFERENCING

Categories have been cross-referenced where appropriate.

Many conditions are known by more than one name. Readers are directed to "See" other relevant category names where resources are also listed. Under CHROMOSOME 4P-, for example, readers are referred to WOLF-HIRSCHHORN SYNDROME.

Some specific disabilities are not covered by a specific national organization. These conditions may be cross-referenced to a broader category that includes organizations that can provide helpful resources. For example, the metabolic condition ARGINASE DEFICIENCY is cross-referenced to UREA CYCLE DISORDERS. In some cases, the reader may be directed to a similar (but not identical) condition, when groups for that condition have indicated the ability and willingness to provide appropriate information and support. For example, 45,X SYNDROME is cross-referenced to TURNER'S SYNDROME and HYPOPIGMENTATION.

In cases where resources are available for both a general category of disability (for example, VISUAL IMPAIRMENT), as well as specific conditions within that general category (for example, ALBINISM; GLAUCOMA; MACULAR DISEASES; RETINITIS PIGMENTOSA, RETINOBLASTOMA; SEPTO-OPTIC DYSPLASIA; and USHER SYNDROME), cross-referencing goes in two directions. Under VISUAL IMPAIRMENTS, for example, readers are informed of the types of visual impairments for which specific resources exist; and under each specific type of visual impairment, readers are referred back to the more general category. The only exception to this type of cross-referencing is the general category MENTAL RETARDATION, which is not used as a cross-referencing term.

In cases where one specific condition usually includes other conditions, but those other conditions do not necessarily include the first condition, cross-referencing goes in one direction only. For example, under LAURENCE-MOON-BARDET-BIEDL SYNDROME (LMBBS), readers are directed to "See also" KIDNEY DISORDERS and RETINITIS PIGMENTOSA, though neither of these conditions refer back to LMBBS. This is because LMBBS typically includes kidney complications and retinitis pigmentosa, but a primary diagnosis of either one of these conditions does not typically include LMBBS.

Cross-referencing assistance came from the organizations listed in this directory, from the National Organization for Rare Disorders (NORD) and their *Resource Guide* (fourth ed., 2000, available for $53.95 including S&H through the EXCEPTIONAL PARENT Library [800] 535-1910; Item Number NO418DI), and from the *Physician's Guide to Rare Diseases* (second ed., 1995, edited by Jess G. Thoene, MD, also available for $45.00 including S&H from the EP Library as Item Number DP1311OD).

USING THIS DIRECTORY

A description of services provided by individual groups follows each listing in this directory. Numbers correspond to items listed in the **Key to Services**, which appears on every other page. When available, e-mail addresses and World Wide Web sites have been included. E-mail addresses are indicated by the symbol, ✉. Web sites are listed with the standard **http://** before each. (Unless otherwise indicated, all telephone numbers are for voice only.)

WHY CHILDREN WHO RELY ON GOODNITES ARE MORE INDEPENDENT.

Independence means different things to different people. For children with bladder or bowel control problems, it could just mean getting through the day dry. That's why something as simple as a change in clothing, can, even in a small way, change a child's way of life.

GoodNites® absorbent underpants can help a child become more independent. With GoodNites, accidents won't become catastrophes. So your child will be able to do more. Plus, because they look like real underwear, kids don't mind wearing them. And since they're easy to pull on and off, they can make a child feel more self-reliant.

GoodNites are available in 3 sizes: 45–65 lbs., 65–85 lbs., and 85–125 lbs. That means finding the size that fits your child will no longer be a problem. Plus they have tear-away sides and they're latex-free.

- *Day and nighttime protection*
- *Latex-free*
- *Tear-away sides for easy removal*
- *Three sizes, to fit kids from 45–125 lbs.*

Pull-Ups
GoodNites
DISPOSABLE ABSORBENT UNDERPANTS
45 lb & over

For Better Days.

Imagine your child gaining a little more independence just by a change in clothing. For information on how GoodNites can help, and a free sample offer, please visit us at www.goodnites.com/offer

We do our best to make extraordinary moments completely ordinary.

Everyone should enjoy their independence. Including those with disabilities. That's why, year after year, GM® Mobility is working hard to offer new ideas and innovations... designed to lower barriers and enhance personal freedom.

This is done with help from a select team of GM designers and engineers -- many who have disabilities of their own -- who bring their unique insights to our products. The result is a lineup of vehicles that offer easy accessibility and visibility. Features pre-designed to simplify modifications. As well as the available security of OnStar®* on most GM vehicles.

To help get you on your way, we offer a complete instructional packet filled with valuable information, from upfitting to financing. To get yours, just call the GM Mobility Assistance Center at 1-800-323-9935. TTY users, call 1-800-833-9935. Or visit us online at www.gmmobility.com.

GM Mobility

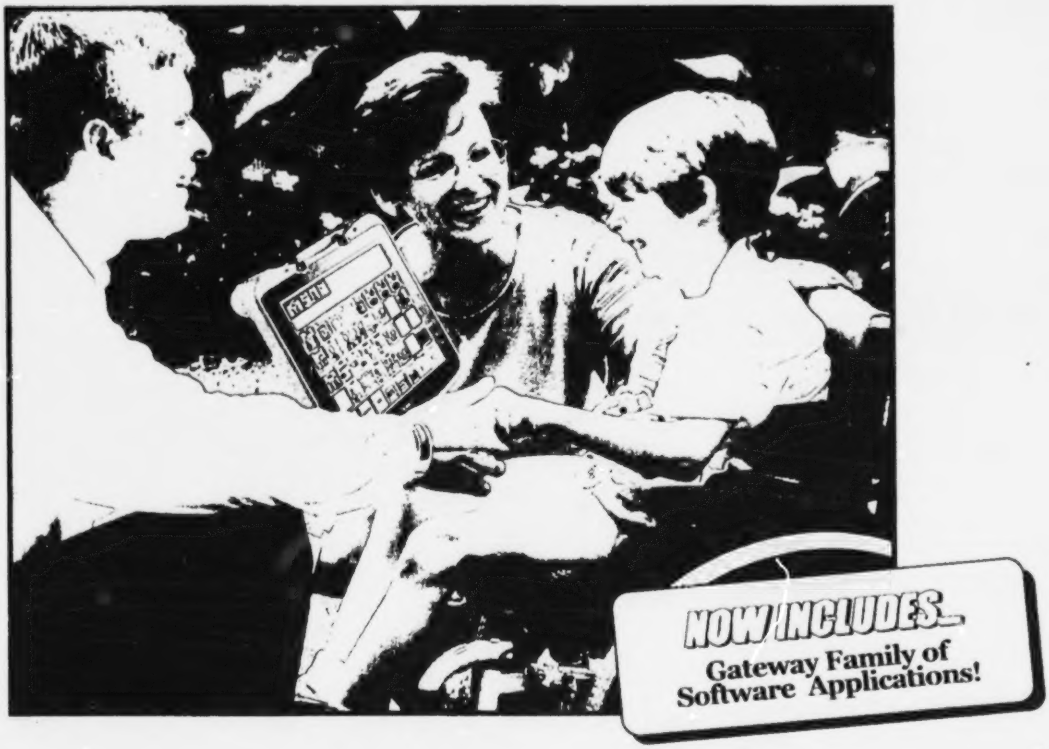
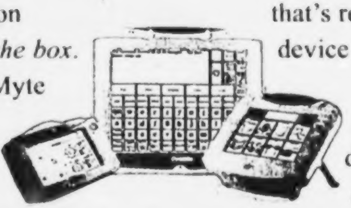
BEST COPY AVAILABLE

Communications for Life Just Got a Whole Lot Easier.



NOW INCLUDES...

Gateway Family of Software Applications!



Now even more DynaVox communication solutions are available to you right *out of the box*. When you order a new DynaVox or DynaMyte communication device, or DynaVox software from DynaVox Systems, you'll now receive ***Gateway to Language and Learning, Gateway 54*** and ***Gateway Junior, all developed by Joan Bruno, Ph.D., CCC-SLP*** *at no additional cost!* Plus, as an added convenience, we will install all three ***Gateway*** software programs on the device before it is shipped to you. More communicators will enjoy all the benefits of having a pre-designed vocabulary system that's ready to use as soon as their DynaVox device arrives.

DynaVox products have been helping people to communicate for nearly two decades. All of the professional associates at DynaVox are committed professionals dedicated to preserving dignity and pride...offering compassion and understanding...providing first quality communication products for the ones you love the most.

By making ***Gateway*** part of the DynaVox package, we're staying ***in touch*** with the kind of communication solutions that professionals want and our customers need.

BEST COPY AVAILABLE

All children should be seen. And heard.

With free Verizon assistive equipment, the lines of communication are open to children with disabilities.

If you're the parent of a child with a disability, you know that talking on the phone is just as important to him as it is to every other child. Which is why, if your child qualifies, you should apply for free assistive equipment from Verizon. To qualify, your child must be under 18 and have a certified disability that hinders him (or her) from using the phone, and receive SSI disability benefits.

The equipment covers the range from TTYs and volume-amplified telephones to light signalers, loud tone ringers, and large-number and hands-free telephones.

As you already know, every child has something to say. Now yours can say it on the phone much easier than before. **For recorded information about the program or to request an application, call 1 800 882-6828 (V) 1 800 299-2640 (TTY)**

This is a limited time offer and applies only to New York State Verizon customers or their dependents living in the same household, for as long as our supply of this equipment lasts.

no more frustration - just fun

LECKEY®

Advance Bath Chair

New Design

The most extensive height range and adjustable seat angles make bath positioning easy.

Extra-soft mesh material and padded support bars give your child a more comfortable and enjoyable bath time.

Take the Advance Bath Chair from the tub to the shower with the optional trolley

Also available is the Basic Bath Support that provides adjustable positioning angles at a fixed height.

And The FUN Doesn't Stop There

Leckey's full line of products have been re-designed to make your child's standing, sitting or toileting experience easier and more enjoyable. Call us today for more information.

- *Lighter mobile bases*
- *More adjustable components*
- *Peer level positioning*
- *Child friendly positioning straps*
- *Playful colors*

ALLERGAN

Allergan, Inc., with headquarters in Irvine, California, is a technology-driven, global health care company that develops and commercializes specialty pharmaceutical products for the eye care, movement disorder, and dermatological markets as well as ophthalmic surgical devices and contact lens care solutions. In over 100 countries worldwide, **Allergan** markets products that deliver value to its customers, satisfy unmet medical needs and improve patients' lives.

Founded in 1948, **Allergan** has approximately 6,200 employees worldwide with 2000 sales of nearly $1.6 billion. **Allergan** is a pioneer in specialty pharmaceutical research, with a strong pipeline of products and technologies related to specific disease areas such as glaucoma, retinal disease, cataracts, dry eye, pain, movement disorders, and retinoid technology platforms with applications in psoriasis, acne, photodamage, metabolic disease, and various types of cancer. The Company has demonstrated its commitment to the Research and Development function by increasing its headcount nearly 30% during the last three years.

Matching Resources

This directory of "Matching Resources"—both national and international—can help some parents who have children with extremely rare conditions or unique combinations of disabilities. Others may be dealing with unique family situations, such as single parenting, raising twins, or adoption. These networking organizations do parent-to-parent matching based on children's disabilities and, in some cases, other unique family situations. Most maintain ongoing contact with other groups worldwide.

Unless otherwise noted, all services are provided free of charge. This symbol, ✉, indicates an e-mail address. All international calls from the US or Canada require dialing 011 before the number. Please be aware of time zone differences when making any calls, particularly international ones. (Unless otherwise noted, telephone numbers are for voice only.)

65 East Route 4
River Edge, NJ. 07661
(201) 489-0633 (fax)
✉epedit@aol.com
http://www.eparent.com
Parents, professionals, and other searching for information, networking, or advice on a disability or related problem may send correspondence to Exceptional Parent's Search & Respond column in the magazine and/or on the Web site: http://www.eparent.com. Some letters are selected for publication in the monthly column. Anyone offering a suggestion may write a "Respond" letter, which will be forwarded and may also be published.

PARENT TO PARENT PROGRAMS

Parent to Parent (P-P) programs provide informational and emotional support to parents who have a child, adolescent, or adult family member with special needs. P-P programs offer an important connection for a parent who is seeking support for a disability-related issue by matching him or her with a trained "veteran" parent who has already "been there." Because the two parents share so many common concerns and interests, the support given and received is often uniquely meaningful. The Parent to Parent match between two parents who both have family members with special needs provides support that is different from that provided in support groups or by professionals.

P-P programs have been providing one-to-one matches for more than 25 years. The major components are screening and training of veteran parents, careful matches based on similar family and disability issues, and follow-up support for each match. Many P-P programs also offer a range of other activities including parent groups for education and support, social events, resource libraries, and services for other family members. Some states have a statewide P-P program that offers training and technical assistance to local programs. These statewide P-P programs often have extensive computerized databases that allow them to make a statewide match when an appropriate local match cannot be found.

INTERNATIONAL PARENT TO PARENT CONFERENCE

Every other year, parents, P-P program directors, and other professionals in the families and disability field, gather at the International Parent to Parent Conference. The Eleventh International Parent to Parent Conference will be held in Philadelphia, Pennsylvania, April 4-7, 2002. For further information, please contact: Parent to Parent of Pennsylvania at (717) 540-4722, or visit http://www.parenttoparent.org.

USING THIS DIRECTORY

This directory contains P-P programs that gave Exceptional Parent magazine permission for contact information to be included in the Exceptional Parent Resource Guide and that provided at least both an address and a telephone number. (Unless indicated, all telephone numbers are for voice only.) **Statewide P-P programs have an asterisk (*) by their names,** and local programs that are affiliated with the Statewide program are not listed separately for local programs in the state. If you are looking for a local program in a state that has a statewide program, please contact the statewide program for contact information. When available, e-mail addresses and World Wide Web sites have been included. E-mail addresses are indicated by the symbol ✉. Web sites are listed with the standard http:// before each.

If you do not find a local program in your community, or if you wish to add or make revisions to this list, please contact the Beach Center on Disability, 3136 Haworth Hall, University of Kansas, 1200 Sunnyside Avenue, Lawrence, KS 66045; telephone: (785) 864-7600 (voice/TDD); fax: (785) 864-7605.

PARENT TRAINING & INFORMATION CENTERS

Parent centers in each state provide training and information to parents of infants, toddlers, school-aged children, and young adults with disabilities and the professionals who work with their families. This assistance helps parents participate more effectively with professionals in meeting the educational needs of children and youth with disabilities. To reach the parent center in your state, you can contact **Alliance Coordinating Office:** PACER Center, 8161 Normandale Blvd, Minneapolis, MN 55437-1104; phone (888) 248-0822 or (952) 838-9000; (952) 838-0190 (TDD); (952) 838-0199 (fax); ✉alliance@taalliance.org; http://www.taalliance.org. The Technical Assistance Alliance for Parent Centers (the Alliance) coordinates the delivery of technical assistance to the Parent Training and Information Centers and the Community Parent Resource Centers through four regional centers.

Using this directory

When available, e-mail addresses and World Wide Web sites have been included. E-mail addresses are indicated by the ✉ symbol. Web sites are listed with the standard **http://** before each. (Unless otherwise indicated, all telephone numbers are for voice only.)

Taking The Next Step Together

Moving forward... a new location... a whole-hearted vision

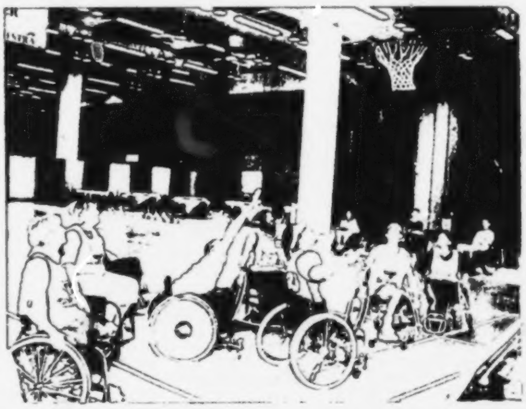
THE THIRD ANNUAL WORLD CONGRESS & EXPOSITION ON DISABILITIES

SHOW DATES:
Thursday, Friday & Saturday—October 3 - 5, 2002
LOCATION:
Orange County Convention Center—Orlando, Florida

A UNIQUE GATHERING— A Disability Conference and Trade Forum, bringing together families and professionals all under one roof. Orlando, one of the world's most popular vacation destinations, is the perfect setting for this coming together. The WCD will attract

physicians ○ families ○ direct support professionals ○ people with disabilities ○ allied health care professionals ○ educators ○ adapted physical education specialists.

TRADE SHOW: Meet with over 250 exhibitors including product & service providers, organizations, manufacturers, retailers, home medical equipment dealers, distributors, long term care, rehabilitation and extended care facilities.



SPECIAL FEATURES

SPORTS & RECREATION ACTIVITY CENTER: Features top athletes with disabilities in basketball, tennis, rugby, soccer, track and field and more.

EMPLOYMENT SYMPOSIUM PAVILION: Human resource managers will discuss career opportunities.

FAMILY, PROFESSIONAL AND GOVERNMENT ORGANIZATIONS: Meet with over 30 national and regional organizations, non-profit associations and professional societies.

CONFERENCE PROGRAM: Comprehensive, multi-disciplinary approach to education. Seminars will focus on medicine, education, family issues, advocacy, assistive technology, adapted physical education and career/employment.

- All WCD attendees can experience discussions by internationally renowned experts specializing in neurology, orthopedics, pediatrics, internal medicine, family medicine, physical medicine, epidemiology, DDS, movement disorders, mitochondrial and metabolic disorders, neonatology, seizure disorders, autism, and other disabilities and chronic conditions as well as general practitioners.
- CME and CEU accreditation will be provided through approved accreditation institutions.
- Hear parents and professionals share strategies and techniques for planning and problem-solving in the home, the family, the community and the world at large.
- An Employment Symposium produced in conjunction with the Florida Department of Education, Division of Vocational Rehabilitation Services will offer sessions for people with disabilities, their families and employers.
- Learn from special education professionals what is going on in classroom environments.
- Participate in adapted physical education activities and seminars.

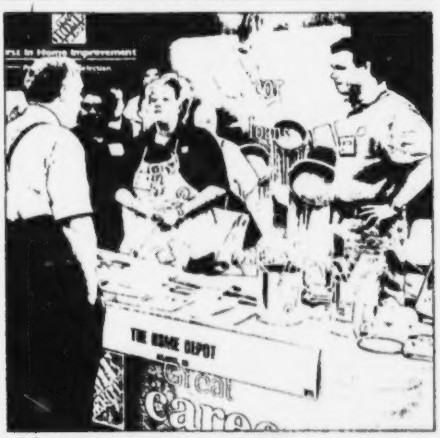
October 3-5, 2002 ○ WORLD CONGRESS & EXPOSITION ON DISABILITIES



The Virtual WCD

The World Congress & Exposition on Disabilities (WCD) completed its second annual event on September 30, 2001. The owners and producers of the WCD felt they had an ongoing responsibility to ensure and facilitate a vibrant, effective marketplace and educational forum for the disability community. Therefore, as part of their commitment to provide the very best possible level of service and to broaden the scope to the widest possible audience, H.A. Bruno, LLC has invested much time, money and effort, in developing a strategic, internet-based event, known as the Virtual World Congress & Exposition on Disabilities (VWCD) (www.vwcdexpo.com).

H.A. Bruno has found a way to reach people with disabilities; their families; caregivers; physicians; nurses; therapists; general education, special education, physical education and adaptive physical education teachers, association members, and many other involved in the disability community. "In 2000, when we held our first event, we heard equally from attendees and exhibitors, 'Why don't you hold this show around the country?' It was just not feasible given the scope of the speakers and exhibitors. The way to reach around the country, and around the world, is through the internet," said William Schwaninger, VWCD director.

Nothing will ever replace the sight and feel of a real conference and exhibition, but for those not able to travel to and experience the WCD, the event is now within reach.

...for those not able to travel to and experience the WCD, the event is now within reach.

With over 240 VWCD exhibitors, attendees can view and then communicate easily with national and local organizations, service providers, the disability media, and manufacturers of products in over 50 industries without ever leaving their home or office. Even for those who were able to attend the WCD this year will now have the ability to keep up with the latest product developments; interact with exhibitors; read the latest in disability news; and learn from industry experts all year long—24 hours a day, seven days a week. The VWCD also has a comprehensive bulletin board which works as a conduit for people in similar situations to communicate. Facilities are in place to broadcast these messages to illicit the greatest number of responses. Future plans include chat rooms and seminars on-demand.

EP ("Exceptional Parent") magazine, through its web site (www.eparent.com), and VWCD will begin immediately working together to bring much needed information to the disability community. EPs educational content and reach will add an important element previously missing from the VWCD. Many non-profit associations and societies have already set up links to the VWCD and many more are soon expected to give their members easy access to the products and services VWCD has to offer.

The World Congress & Exposition on Disabilities has become the leading event for interdiscipline communications by offering a forum where professionals, children and adults with disabilities, their families and caregivers can meet, discuss and provide advice and support to each other. The Virtual WCD will now provide continued education and solutions as well as extend its reach throughout all segments of the disability community.

The WCD is organized by H.A. Bruno, LLC, a company whose senior management was previously associated with Blenheim Group, PLC, the world's largest trade show company and producer of more than 400 shows worldwide. The conference portion of the program is sponsored by the EP Foundation for Education, Inc., a 501(C)3 not-for-profit organization dedicated to improving the lives of people with disabilities, special health care needs and chronic conditions, and the families and others involved in their care and development. For more information on WCD, visit www.wcdexpo.com or call 877-WCD-EXPO.

- ☐ **View the latest products and services**
- ☐ **Read updated news items**
- ☐ **Communicate with people in the disability community**
- ☐ **Use the comprehensive bulletin board**

Everyone and anyone working with individuals with disabilities should attend this conference. It's a must!

Gloria Y. Stallworth, Human Services Senior Practitioner,
Wake Co. Human Services, Raleigh, NC

It was refreshing to see parents, doctors, therapists, classroom teachers and adapted physical educators all grouped together with a common interest.

R. R. Apache, Assistant Professor,
University of Nevada, Las Vegas, NV

The recent conference in Atlanta was a great experience. It was really helpful to see what other professionals in other states are doing. Overall the conference was excellent and I would encourage other professionals in my field to attend. I am planning to attend the WCD next year in Orlando.

Beverley Charles, an attendee, Mental Retardation
Developmental Administration, Washington, DC.

A great opportunity to learn from creative and inspirational adapted physical activity presenters.

Fiona Connor-Kuntz, APE Teacher, CH-UH Schools,
Cleveland Heights, OH

One word simply cannot sum up the experience. Try, AWESOME, WONDERFUL, INFORMATIVE, ORIGINAL, CREATIVE, EXCITING, INNOVATIVE AND EXTREMELY WELL ORGANIZED. The Muscular Dystrophy Family Foundation has been affiliated with the WCD from its conception. Whether you are a professional in the health care field, a parent, client, teacher, physical therapist, occupational therapist or a vendor, there is something for everyone to gain. And...the networking ability is outstanding! We are excited about the 2002 event and proud to be a supporting sponsor.

Judith R. Duncan, President/CEO,
Muscular Dystrophy Family Foundation,
Indianapolis, IN

EP1/02

October 3-5, 2002 ◦ WORLD CONGRESS & EXPOSITION ON DISABILITIES

ASSOCIATION OF UNIVERSITY CENTERS ON DISABILITIES

Authorized by federal legislation to help people with developmental disabilities and their families participate fully in their communities, University Centers for Excellence (UCEs) operate in academic settings to provide training, education, and direct services; conduct research; share information; and help consumers and their families find services. As a bridge between the academic world and the developmental disabilities service delivery system, UCEs work collaboratively with state agencies, their local affiliates, and various nongovernmental consumer-based organizations to build the capacity of communities to sustain all their citizens, including people with special needs.

Mental Retardation/Developmental Disabilities Research Centers (DDRCs), indicated by an (R) following the center name, are also included in this directory even though they are research–as opposed to direct service–facilities. These centers develop essential knowledge and information upon which to base new and improved treatments, supports, and services. Some of these research centers are housed at the same academic settings as the UCEs providing direct services. These listings were provided by the Association of University Centers on Disabilities, 8630 Fenton St., Ste. 410, Silver Spring, MD 20910; telephone: (301) 588-8252 (voice); (301) 588-3319 (TDD); fax: (301) 588-2842. Web site: http://www.aucd.org. When available, e-mail addresses and World Wide Web sites have been included. E-mail addresses are indicated by the symbol, ✉. Web sites are listed with the standard http:// before each. (Unless otherwise indicated, telephone numbers are for voice only.)

ALLIANCE FOR TECHNOLOGY ACCESS CENTERS

The Alliance for Technology Access (ATA) began in 1987 as a joint project of a grassroots organization, the Disabled Children's Computer Group and a major corporation, Apple Computer™. From this small group of parents, consumers, and professionals, the ATA has grown into one of the nation's largest resources to help children and adults who have disabilities gain access to the benefits of assistive technology.

The Alliance for Technology Access (ATA) is a national network of Resource Centers, individual and organization Associate members and vendor members. All local nonprofit ATA Resource Centers are operated through a collaboration of people with disabilities, family members, and professionals in related fields. All are barrier-free in architecture as well as in attitude, and are committed to providing services, information and referral for everyone who contacts them. Associate members include a wide range of individuals and organizations who work in their own communities and ways to support our mission.

The mission of the Alliance for Technology Access is to connect children and adults with disabilities to technology tools. If you support this mission, we invite you to join us in realizing its potential.

By joining ATA you become a part of a vital nationwide network with the most up-to-date information about assistive technology. Stay on the cutting edge of the latest technological innovations, test and refine new products. Join others who are key players in the world of technology access.

To get more information about the Alliance for Technology Access (ATA) and/or how to become a member, contact the national office at (800) 455-7970 or visit the ATA Web site: http://www.ATAccess.org.

This listing was provided by the ATA (for the National Office, see below). Editor's Note: When available, World Wide Web sites and e-mail addresses have been included. Web sites are listed with the standard http:// before each. E-mail addresses are indicated by the symbol, ✉. (Unless otherwise indicated, all telephone numbers are for voice only.)

Berkshire Meadows

Nestled in the serene beauty of Western Massachusetts' Berkshire Hills, Berkshire Meadows offers a comprehensive, integrated year-round residential program for children, adolescents and young adults who are severely developmentally delayed and may be multiply disabled.

We help our population become more independent, more self-sufficient and empowered. For their families we strive to offer education, encouragement, and support. We believe that all people, no matter how severe their disabilities, should be given the opportunity to achieve their maximum potential.

Berkshire Meadows

STATE ASSISTIVE TECHNOLOGY PROGRAMS

The following state assistive technology programs are funded by the National Institute on Disability and Rehabilitation Research (NIDRR) under the Assistive Technology Act of 1998 (P.L. 105-394). The Assistive Technology Act of 1998 provides federal support for a nationwide program of grants to states to help individuals with disabilities obtain access to and funding for assistive technology devices and services. There are 56 state assistive technology projects, one located in each of the 50 states, the District of Columbia, American Samoa, Guam, the Commonwealth of the Northern Marianas, Puerto Rico, and the U.S. Virgin Islands.

Among other services, the Assistive Technology Act allows states to help individuals learn more about the many ways assistive technology can help them live, work, and learn more independently.

Depending on priorities in the states, the projects may provide the following regarding assistive technology devices and services:

- Information and referral
- Regional centers, demonstration centers
- Funding and policy information
- Training and technical assistance
- Financial loan programs
- Equipment recycling programs, device lending libraries

For more information, contact: RESNA Technical Assistance Project, 1700 N. Moore St., Ste. 1540, Arlington, VA 22209-1903; (703) 524-6686 (voice); (703) 524-6630 (TDD); (703) 524-6630 (fax); E-mail: resnata@resna.org. You may also wish to check out the project's Web site: http://www.resna.org/taproject.

Contact your state assistive technology program for more information. E-mail addresses are indicated by the symbol ✉. (Unless otherwise indicated, telephone numbers are for voice only.)

Discover the faces of Children's Hospital

Everyday we take special care of children. From broken bones to long-term care, from infants to teens. It's our understanding of children and their families that makes us unique.

For over 80 years now, Richmond's Children's Hospital has been providing specialty pediatric care. We understand children. And what it takes to tailor our services to their individual needs.

Take for example, our Pediatric Feeding Disorders Program, one of only a few such services in the country.

Or our Inpatient Rehabilitation Program which helps children who have experienced trauma, disease or impairments return to the activities of daily life.

For adolescents who need subacute care to babies who have never seen the outside world, our Transitional Care Unit is a step toward home. And a place where parents learn to care for their child's special needs.

Discover where children come first.

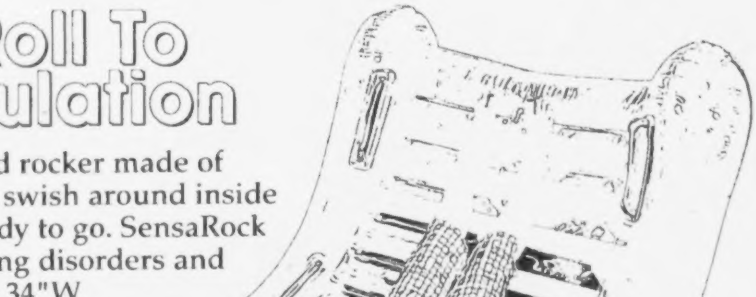
Rock And Roll To Sensory Stimulation

The SensaRock™ is an inflatable, kid-tested rocker made of high-quality vinyl with 40 small balls that swish around inside when moved. Simply inflate it and it's ready to go. SensaRock is ideal for children with sensory processing disorders and large motor deficiencies. Measures 52"L x 34"W (inner width: 24"). Features 6 handles, 40 balls and numbers and letters that add cognitive appeal. Repair patch included.
The SensaRock, as well as a multitude of other sensory products and information, is available by calling 800-850-8602.



Abilitations™

For more detailed information or to request a free, 240-page catalog filled with products for children's rehabilitation, call 800-850-8602 or visit www.abilitations.com

Circle #120 or visit www.eparent.com/adinfo

CHILDREN'S HOSPITALS

The National Association of Children's Hospitals and Related Institutions (NACHRI) is a national organization of children's hospitals with members in the United States, Canada, Mexico, Puerto Rico, and Singapore. NACHRI promotes the health and well-being of all children and their families through support of children's hospitals and health systems that are committed to excellence in providing healthcare to children. It does so through education, research, health promotion, and advocacy. NACHRI's 160 member institutions work to ensure children's access to healthcare and the continuing ability of children's hospitals to provide services needed by children.

This listing includes NACHRI **members, associates,** and **supporters**. NACHRI members comprise freestanding children's hospitals, children's hospitals within hospitals, and specialty hospitals. The **specialty** children's hospitals provide clinical specialization in • orthopedics, • rehabilitation, • chronic diseases, or • psychiatry. One of the specialty hospitals, Texas Scottish Rite Hospital for Children in Dallas, Texas, is supported by private donations and does not bill for services. The hospital specializes in pediatric orthopedics and learning disabilities and treats children who meet its Texas residency requirements. • A group comprising 22 **Shriners children's hospitals** is also a NACHRI member. These hospitals specialize in orthopedics and burn treatment and provide their very expensive treatments free of charge.

For more information about NACHRI children's hospitals, visit the NACHRI Web site at http://www.childrenshospitals.net. Direct links are available to most members listed under "About NACHRI." For more information about NACHRI contact member services at NACHRI, 401 Wythe Street, Alexandria, VA 22314; telephone: (703) 684-1355; (703) 684-1589 (fax); E-mail: lbaldwin@nachri.org.

TITLE V

Every state has a Title V Program which is funded, in part, through the Federal Title V Block Grant that provides health-related services to children with special healthcare needs—sometimes abbreviated as "CSHCN"—and their families. Title V Programs also provide assistance in accessing other services that CSHCN and their families need, such as parent support and information networks. The financial eligibility criteria, residency criteria, and medical eligibility criteria for these Programs varies from state to state. These Programs are also known by different names in different states. The following is a list of contacts in each of the state Title V CSHCN Programs. The listing is based on the "Directory of State Title V CSHCN Programs: Eligibility and Scope of Services." This report was developed by the Institute for Child Health Policy in Gainesville, FL, with financial support from the Maternal and Child Health Bureau, (US Department of Health and Human Services) and with technical assistance from the Association of Maternal and Child Health Programs. The information contained in this report is also available through the Internet. The address on the World Wide Web is http://www.ichp.edu.

USING THIS DIRECTORY

When available, World Wide Web sites and e-mail addresses have been included. Web sites are listed with the standard http:// before each. E-mail addresses are indicated by the symbol, ⊠. (Unless otherwise indicated, all telephone numbers are for voice only.)

ADA PROJECTS

Disability and Business Technical and Assistance Centers

The National Institute on Disability and Rehabilitation Research (NIDRR) of the U.S. Department of Education has established ten regional Disability and Business Technical Assistance Centers (DBTACs) to provide information, training, and technical assistance to employers, people with disabilities, advocates for people with disabilities and other entities with responsibilities under the Americans with Disabilities Act (ADA).

The centers act as a "one-stop" central, comprehensive resource on ADA issues in employment, public services, public accommodations (private for profit and non-profit businesses), and communications. Each center works closely with local business, disability, governmental, rehabilitation, and other professional networks to provide ADA information and assistance. Programs vary in each region, but all centers provide the following:

- Technical Assistance
- Education and Training
- Materials Dissemination
- Information and Referral
- Public Awareness
- Local Capacity Building

The DBTACs are also providing information and technical assistance on education-based information technology, such as websites, software and hardware, in collaboration with the National Center on Accessible Information Technology in Education (AccessIT). Contact:

AccessIT
Box 355670
University of Washington
Seattle, WA 98195-5670
206-616-2223 (voice and TDD)

✉accessit@u.washington.edu
http://www.washington.edu/accessit/

Using this directory

Contact the DBTAC's toll-free at: (800) 949-4232 (voice/TDD). Your call will automatically be routed to the DBTAC in your region.

This list was provided by Adaptive Environments, the New England DBTAC. When available, World Wide Web sites and e-mail addresses have been included. Web sites are listed with the standard http:// before each. E-mail addresses are indicated by the symbol ✉. (Unless otherwise indicated, all telephone numbers are for voice only.)

National Access for Public Schools Project

The National Access for Public Schools Project has also been funded by NIDRR to answer questions about the ADA in public schools. For information, contact Adaptive Environments, Inc., at 374 Congress St., Ste. 301 Boston, MA 02210; (800) 893-1225, Ext.28 (voice/TDD). They can also be found on the Internet at http://www.adaptenv.org.

With the Creepster Crawler, You Can Watch Your Child Crawl for the First Time!

Children lacking head control, the ability to roll over or belly crawl have gained mobility with the ***Creepster Crawler.*** Using this light, innovative device, hundreds of children around the world are crawling, working more productively with their therapists, and gaining a head start to more advanced mobility in the future.

The ***Creepster Crawler*** is an ideal solution for youngsters with debilitating conditions such as ☐ Spina Bifida ☐ Down Syndrome ☐ Cerebral Palsy ☐ TBI, and ☐ developmental delays. Children with tracheostomies and G-Tubes also are successful users of the ***Creepster Crawler***.

The ***Creepster Crawler***'s frame has a padded platform that can support a parent or therapist from above, making it easier to work with the child on weight-bearing, weight-shifting, reaching and creeping. Front shoulder, chest and rear straps can be adjusted for individual fit.

Please visit our Worldwide Web site at www.red-enter.com for additional details and a video demonstration of the ***Creepster Crawler***.

Speaking of fun...

Natasha is learning to communicate, but has a long way to go. In the meantime we're learning what she has to say through pictures in her communication book. She's working toward more sophisticated methods of expressing herself, but this gives her a way of speaking to us right now. Every day is an adventure for Natasha, and we don't want to miss a thing.

CROTCHED
MOUNTAIN
OFFERING A LIFELONG ALLIANCE
TO PEOPLE WITH DISABILITIES

PRESIDENT AND CHIEF EXECUTIVE OFFICER

CROTCHED MOUNTAIN FOUNDATION
Greenfield, New Hampshire

Crotched Mountain Foundation (CMF) invites nominations and expressions of interest for the position of President and CEO as a result of the upcoming retirement of its current President.

Situated on a gorgeous mountaintop campus of over 1,400 acres in Greenfield, NH (located 45 minutes from Manchester, NH and two hours from Boston in southern New Hampshire), Crotched Mountain is a premier organization providing education, rehabilitation, medical and community living services for children and adults with disabilities throughout New Hampshire and neighboring states for nearly 50 years. The Greenfield campus is home to the Crotched Mountain School, a residential and day special education facility for 125 children with disabilities, a skilled nursing facility and rehabilitation center for adults with brain injuries, an outpatient clinic that provides a range of medical and rehabilitation services to people with disabilities, a specialty hospital for children, and other service programs. Crotched Mountain also provides care management, housing and rehabilitation services in locations throughout New Hampshire and in northeastern Massachusetts, New York State and Maine. Through its affiliated corporations, CMF serves more than 1,500 children and adults with disabilities annually. CMF has 780 employees and an annual budget in excess of $30 million.

CMF seeks candidates with exceptional leadership skills, a record of professional achievement and management experience in large, diverse organizations, a commitment to the mission of the organization, and who possess both the vision and the strategic mind to chart the future for this unique organization to continue its evolution as a family-centered community resource. A collegial, team oriented management style will be critical to continuing the high performance culture that has been built at CMF. Successful experience in both advocacy and fundraising are strongly preferred. A passion for improving the lives of individuals with disabilities and their families is a must.

CMF has retained the services of Witt/Kieffer, a national executive search firm, to assist in this important search. Nominations and expressions of interest in the position should be directed to:

Emanuel D. Berger and Paul W.H. Bohne
Witt/Kieffer
4550 Montgomery Ave, Suite 615N
Bethesda, MD 20814

Questions and requests for a complete position description can be directed to Paul W.H. Bohne at (301) 654-5070 or Manny Berger at (781) 272-8899 or via e-mail at paulb@wittkieffer.com

Crotched Mountain Foundation
is an equal opportunity employer.

PREVENTABLE DISABILITIES!

Dear Parents:

When my son was born with cerebral palsy, my family and I had no idea how our lives would be affected. We did not see how vulnerable our child was and how he would need our care and protection for the rest of his life. We did not understand that we would become his life-line in so many ways, and he in turn would consume our lives.

As an attorney, I have become deeply involved in brain injury and other birth injury cases throughout the country.

We would be interested in looking into your child's birth if you had complications either during pregnancy, during delivery, or after delivery.

Our medical staff includes a board certified obstetrician and a registered obstetrical nurse.

Please call 1-800-888-LAWS and speak with either an attorney or a registered nurse.

Remember, there are time restrictions.

Sincerely,

Sheldon O Zisook

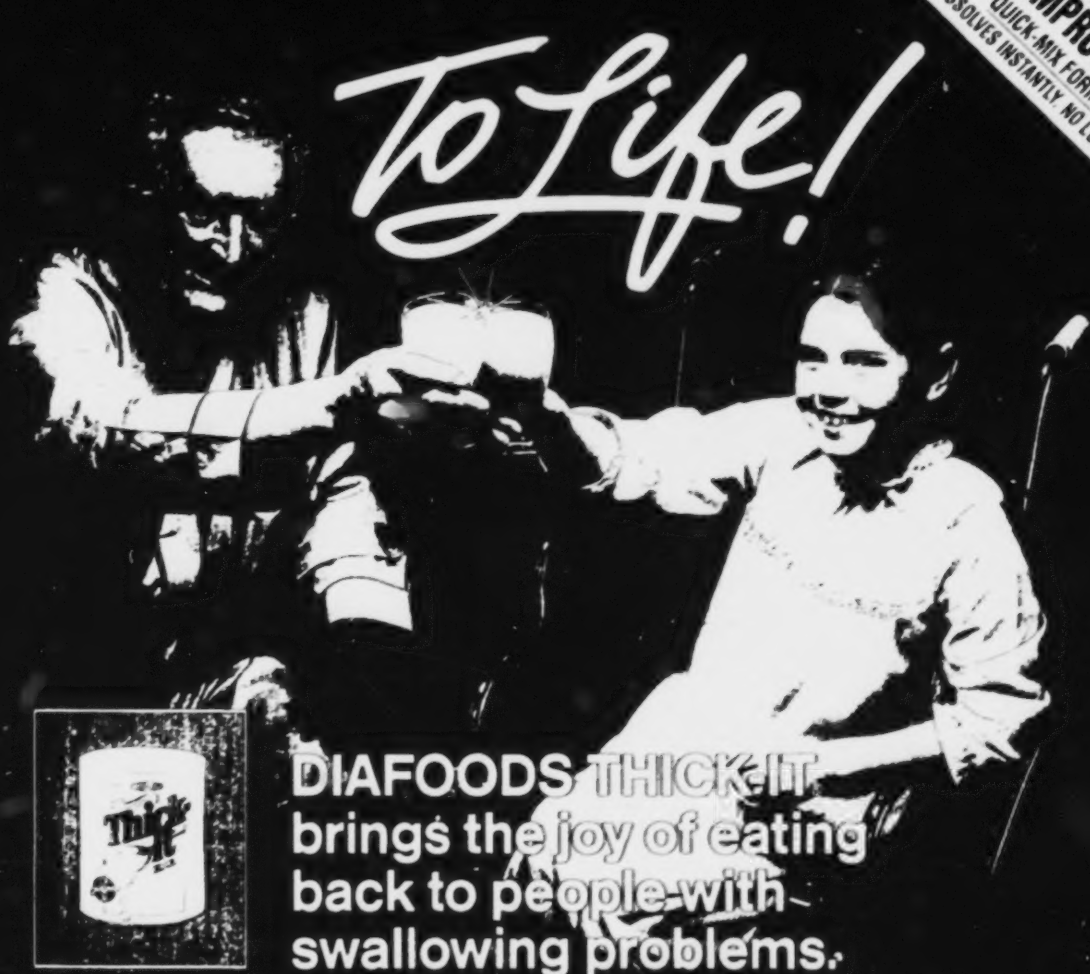
NEW
IMPROVED
QUICK-MIX FORMULA
DISSOLVES INSTANTLY. NO LUMPING.



DIAFOODS THICK-IT brings the joy of eating back to people with swallowing problems.

Here's the solution for the millions of young and old who need modified consistencies to enjoy eating.

DIAFOODS THICK-IT, when mixed with hot or cold, thick or thin liquids and pureed foods, produces any desired consistency quickly, easily and controllably. But it does not change the taste or appearance of the food it thickens.

DIAFOODS THICK-IT adds sixteen calories per tablespoon for nourishment but is very low in sodium for people on sodium-restricted diets. And it helps hydrate patients because it will not bind water or fluids.

DIAFOODS THICK-IT is the market-maker and the #1 selling brand of Instant Food Thickener. It is recommended by speech and language pathologists, dietitians and nutritionists in hospitals, nursing homes and rehabilitation facilities across the country.

Free educational material, call... (800) 333-0003.

The booklet **"Dysphagia, A Review For Health Professionals"** discusses causes, evaluation and treatment of dysphagia.

The pamphlet **"Swallowing Problems"** helps patients and caregivers understand and adapt to dysphagia.

For product literature and advice, a free sample and information where **DIAFOODS THICK-IT** may be purchased, **call... (800) 333-0003.**

EARLY INTERVENTION

The Individuals with Disabilities Education Act (IDEA) requires all states and territories to provide early intervention and preschool special education for children with disabilities and special healthcare needs. When available, this directory lists these resources for each state or territory:

- Chairpersons of Interagency Coordinating Councils (**ICC**): ICCs include representatives of agencies, service providers, and families. Their role is to advise and provide assistance on early intervention programs and, in some states, preschool services as well.
- Coordinators of infant and toddler programs serving children from birth to age three are known as **Part C** programs.
- Coordinators of preschool special education programs (known as **619** programs) serving children from ages three through five.

These listings are provided by the National Early Childhood Technical Assistance Center (NECTAS, Frank Porter Graham Child Development Center, University of North Carolina at Chapel Hill, 137 E. Franklin St., Suite 500, Chapel Hill, NC 27514; Telephone: (919) 962-2001 (voice); (877) 574-3194 (TDD); Fax: (919) 966-7463; E-mail: nectas@unc.edu; and are current as of November 2001. This information is also available on the NECTAS Web site: http://www.nectas.unc.edu, and is updated on a monthly basis. NECTAS is operating under a no-cost extension from its funding sponsor, the US Department of Educaton.

Using This Directory

When available, e-mail and World Wide Web sites addresses have been included. E-mail addresses are indicated by the symbol ✉. Web sites are listed beginning with their address, so remember to include the standard http:// before each. (Unless otherwise indicated, all telephone numbers are for voice only.)

FEDERAL & FEDERALLY FUNDED INFORMATION RESOURCES

The federal government supports many clearinghouses, information centers, and institutes that focus on specific topics. In addition to publishing and distributing extensive free material on disability-related subjects, many of the clearinghouses, centers, and institutes also provide referrals to local resources. For more information on federal and federally-funded information resources, contact:

- **NICHCY** (National Information Center for Children and Youth with Disabilities), PO Box 1492, Washington, DC 20013-1492; (800) 695-0285 (V/TDD); (202) 884-8200 (V/TDD); (202) 884-8441 (fax).

QUANTUM™
DYNAMO®

The Quantum™ Dynamo® series offers children fun, independence and confidence in their abilities. With Quantum Rehab's patented mid-wheel drive performance, children can play, explore and keep up with their friends.

- Kid-friendly styling and six all-new fun colors that allow children to express their own individuality
- Compact size delivers easy turning, even in kid-sized spaces
- Achieves sizes as small as 10" x 10" with Versa Seat and 12" x 12" with power tilt
- Seat-to-floor heights as low as 15" - perfect for maneuvering under school desks
- Available dual platforms provide easier transfer and extra support for shorter legs
- On-board battery charger for added convenience
- Disassembles for easy transport

NATIONAL INFORMATION & ADVOCACY RESOURCES

These national organizations are information and advocacy resources for families and professionals. Many of these organizations provide a variety of services, others focus on more specific areas of concern. Numbers following each listing correspond to items listed in the **Key to Services,** which describes services provided by individual organizations. We have tried to list as much information as possible on each group, but it is best to contact the organization directly for a full description of services.

When available, e-mail addresses and World Wide Web sites have been included. E-mail addresses are indicated by the symbol, ✉. Web sites are listed with the standard http:// before each. (Unless otherwise indicated, all telephone numbers are for voice only.)

"Imagine if Your Child Could Follow Instructions and Accept No"

When a child sustains a brain injury traditional treatment sometimes isn't enough. It takes a transdisciplinary team approach that includes a strong behavior program in addition to educational, medical, pharmacological and restorative therapies. The behavior program is directed towards restoring the child's self-control andself-image.

At the FLORIDA INSTITUTE FOR NEUROLOGIC REHABILITATION, INC., (FINR) our sole concern is brain injury rehabilitation and our pediatric/adolescent services and model school programs focuses on the kids "Getting better and having fun again." Individual Education Plans are a primary tool used to aid the children in reaching their academic potential.

BEHAVIORAL STRATEGIES
MANAGEMENT

The kids begin to complete tasks and families learn techniques needed in order to ensure appropriate follow through once discharge occurs.

Traditional settings and therapies are sometimes not enough so please call us and we can provide you and your child with the resources and staff expertise to insure a successful outcome.

Please use our toll free number and call us at 1-888-TBI FINR or log on to our web site at www.finr.org

Our qualified representatives are available nationally to conduct pre-screening field evaluations or schedule facility tours at no cost or obligation.

INTERNATIONAL GUIDE TO MOVEMENT DISORDER PATIENT ADVOCACY GROUPS AND FOUNDATIONS

From WE MOVE (Worldwide Education and Awareness for Movement Disorders)

This guide provides a comprehensive listing of national, regional and international support organizations committed to improving the quality of life for people with movement disorders. They are arranged alphabetically by disease and by country. Some of these organizations have established support services with local chapter affiliates for individuals with specific movement disorders and their families. Many provide referrals, publish educational materials, host Web sites, raise funds and provide grant money for scientific research. (Please see the key to services on the bottom of every other page.) All of these organizations share a common goal: to facilitate accurate and timely diagnosis of movement disorders and access to up-to-date treatment. This listing also appears on the WE MOVE Web site (http://www.wemove.org), the Internet's most comprehensive resource for movement disorder information and activities.

WE MOVE is a not-for-profit organization committed to educating and informing healthcare professionals, people with movement disorders and the public about neurologic movement disorders. WE MOVE can assist those who wish to establish new organizations where no national group exists. For more information, please contact: WE MOVE, 204 W. 84th St. New York, NY 10024, USA; phone: (800) 437-6882 or (212) 875-8312; fax: (212) 875-8389, e-mail: wemove@wemove.org; Web site: http://www.wemove.org.

USING THIS DIRECTORY

When available, World Wide Web sites are listed with the standard http:// before each. (Unless otherwise indicated, all telephone numbers are for voice only.) *Editor's Note: Telephone numbers are listed after the words TEL:, fax numbers are after the word FAX:, e-mail addresses are indicated by the symbol ✉. Please note that since this directory contains international organizations, be sure to use 011 when dialing from the United States.*

STATE DIRECTORS OF SPECIAL EDUCATION

Every state has a state education agency that is responsible for general supervision of the state's special education services for children and young adults with disabilities. Within each agency, one individual has the primary responsibility of overseeing these services. Usually, this person is called the State Director of Special Education. This individual—or his or her staff—can direct parents to appropriate local resources; is knowledgeable about the state's procedural safeguard system (the system for handling complaints, mediation, and due process procedures); and can offer other assistance as needed.

The listings in this directory were provided by the National Association of State Directors of Special Education [NASDSE, 1800 Diagonal Rd., Alexandria, VA 22314; (703) 519-3800 (voice); (703) 519-7008 (TDD); (703) 519-3808 (fax)], and are current as of November 2001.

Who will care for your disabled child when you are gone?

Litigators Incorporated, P.C.
& Affiliated Law Firms

ATTORNEYS ACROSS THE NATION

Dear Parents:

My sister died leaving behind a disabled child. If you have a child with a disability, the obligation for his or her care continues even after you are gone. My name is Jeff Brody, President of Litigators Incorporated, P.C. Let us help you find out if your child's disability was preventable; you could be entitled to substantial compensation for the lifetime care of your child. You owe it to your child to protect their future. There are time limits, please call me

Check out my web-site at
www.thelitigatorsinc.com

Litigators Incorporated, P.C. is an Illinois licensed corporation with affiliated law firms throughout the United States

CAN YOU FIND THE SYMPTOMS OF CARNITINE DEFICIENCY IN THIS PICTURE?

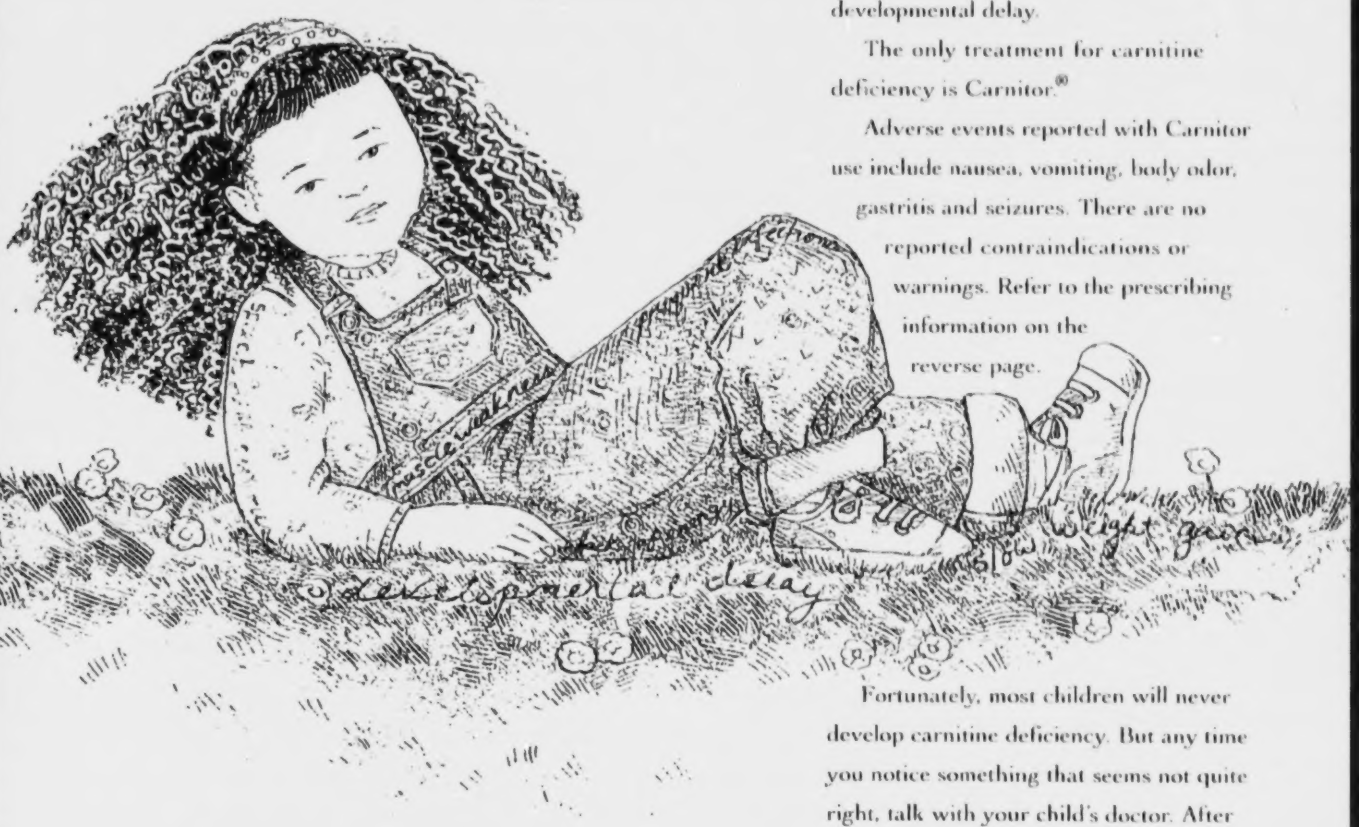
No one knows your child as well as you do. So no one's better at seeing the subtle things that affect your child's health. Things like carnitine deficiency.

Carnitine is a naturally occurring substance that's essential in the metabolic process. If the body is deficient in carnitine, the ability of the cells to produce energy and to remove toxic wastes is impaired. And while carnitine deficiency can be serious, its symptoms are hard to detect and are often overlooked.

Signs include muscle weakness, frequent infection, seizures, poor muscle tone, slow growth, speech difficulties, slow weight gain, lack of energy and developmental delay.

The only treatment for carnitine deficiency is Carnitor.®

Adverse events reported with Carnitor use include nausea, vomiting, body odor, gastritis and seizures. There are no reported contraindications or warnings. Refer to the prescribing information on the reverse page.



Fortunately, most children will never develop carnitine deficiency. But any time you notice something that seems not quite right, talk with your child's doctor. After all, only you see the whole picture.

For more information, visit www.carnitor.com. Or call 1-800-447-0169.

Carnitor® levocarnitine
Tablets 330mg • Oral Solution 1g/10ml

Carnitor®
levocarnitine

Tablets 330mg • Oral Solution 1g/10mL

CARNITOR® (levocarnitine) Tablets (330 mg)
CARNITOR® (levocarnitine) Oral Solution (1 g/10 mL multidose)
FOR ORAL USE ONLY. Not for parenteral use. Rx only.

BRIEF SUMMARY

The following is a brief summary. Please see package insert for full prescribing information.

CLINICAL PHARMACOLOGY

CARNITOR® (levocarnitine) is a naturally occurring substance required in mammalian energy metabolism. It has been shown to facilitate long-chain fatty acid entry into cellular mitochondria, therefore delivering substrate for oxidation and subsequent energy production. Fatty acids are utilized as an energy substrate in all tissues except the brain. In skeletal and cardiac muscle they serve as major fuel. Primary systemic carnitine deficiency is characterized by low plasma, RBC, and/or tissue levels. It has not been possible to determine which symptoms are due to carnitine deficiency and which are due to the underlying organic acidemia, as symptoms of both abnormalities may be expected to improve with carnitine. The literature reports that carnitine can promote the excretion of excess organic or fatty acids in patients with defects in fatty acid metabolism and/or specific organic acidopathies that bioaccumulate acyl CoA esters.

Secondary levocarnitine deficiency can be a consequence of inborn errors of metabolism. CARNITOR® may alleviate the metabolic abnormalities of patients with inborn errors that result in accumulation of toxic organic acids. Conditions for which this effect was demonstrated are: glutaric aciduria, II, methyl malonic aciduria, propionic acidemia, and medium chain fatty acyl CoA dehydrogenase deficiency. Autointoxication occurs in these patients due to the accumulations of acyl CoA compounds that disrupt intermediary metabolism. The subsequent hydrolysis of the acyl CoA compound to its free acid results in acidosis that can be life threatening. Levocarnitine clears the acyl CoA compound by formation of acyl carnitine which is quickly excreted.

Levocarnitine deficiency is defined biochemically as abnormally low plasma levels of free carnitine, (less than 20 µmol/L at one week post term) and may be associated with low tissue and/or urine levels. Further, this condition may be associated with a ratio of plasma ester/free levocarnitine levels greater than 0.4 or abnormally elevated levels of esterified levocarnitine in the urine. In premature infants and newborns, secondary deficiency is defined as plasma free levocarnitine levels below age related normal levels.

BIOAVAILABILITY/PHARMACOKINETICS

In a relative bioavailability study in 15 healthy adult male volunteers CARNITOR® Tablets were found to be bio-equivalent to CARNITOR® Oral Solution. Following the administration of 1980 mg b.i.d., the maximum plasma concentration level (C_{max}) was 80 nmol/mL and the time to maximum concentration (T_{max}) occurred at 3.3 hours. There were no significant differences for AUC and urinary excretion observed between these two formulations.

In the same bioavailability study of 15 healthy adult males, CARNITOR® (levocarnitine) Injection administered as a slow 3 minute bolus intravenous injection at a dose of 20 mg/kg showed that free levocarnitine plasma profiles are best fit by a two compartment model. Approximately 76% of free levocarnitine is eliminated in the urine. Using plasma levels uncorrected for endogenous levocarnitine, the mean distribution half life was 0.585 hours and the mean apparent terminal elimination half life was 17.4 hours following a single intravenous dose.

The absolute bioavailability of L-carnitine from CARNITOR® Tablets and Oral Solution was determined compared to the bioavailability of L-carnitine from CARNITOR® Injection Intravenous in 15 healthy male volunteers. After correction for circulating endogenous levels of L-carnitine in the plasma, absolute bioavailability was 15.1% ± 5.3% for L-carnitine from CARNITOR® Tablets and 15.9% ± 4.9% from the Oral Solution.

Total body clearance of L-carnitine (Dose/AUC including endogenous baseline levels) was a mean of 4.00 L/hr. Endogenous baseline levels were not subtracted since total body clearance of L-carnitine does not distinguish between exogenous sources of L-carnitine and endogenously synthesized L-carnitine. Volume of distribution of the intravenously administered dose above baseline endogenous levels was calculated to be a mean of 29.0 L ± 7.1 L (approximately 0.39 L/kg) which is an underestimate of the true volume of distribution since plasma L-carnitine is known to equilibrate slowly with, for instance, muscle L-carnitine.

L-carnitine was not bound to plasma protein or albumin when tested at any concentration or with any species including the human.

INDICATIONS AND USAGE

CARNITOR® (levocarnitine) is indicated in the treatment of primary systemic carnitine deficiency. In the reported cases, the clinical presentation consisted of recurrent episodes of Reye-like encephalopathy, hypoketotic hypoglycemia, and/or cardiomyopathy. Associated symptoms included hypotonia, muscle weakness and failure to thrive. A diagnosis of primary carnitine deficiency requires that serum, red cell and/or tissue carnitine levels be low and that the patient does not have a primary defect in fatty acid or organic acid oxidation (see Clinical Pharmacology). In some patients, particularly those presenting with cardiomyopathy, carnitine supplementation rapidly alleviated signs and symptoms. Treatment should include, in addition to carnitine, supportive and other therapy as indicated by the condition of the patient.

CARNITOR® (levocarnitine) is also indicated for acute and chronic treatment of patients with an inborn error of metabolism that results in a secondary carnitine deficiency.

CONTRAINDICATIONS

None known.

WARNINGS

None.

PRECAUTIONS

General

CARNITOR® (levocarnitine) Oral Solution is for oral/internal use only.

Not for parenteral use.

Gastrointestinal reactions may result from too rapid consumption of carnitine. CARNITOR® (levocarnitine) Oral Solution may be consumed alone, or dissolved in drinks or other liquid foods to reduce taste fatigue. It should be consumed slowly and doses should be spaced evenly throughout the day to maximize tolerance.

Carcinogenesis, mutagenesis, impairment of fertility

Mutagenicity tests performed in *Salmonella typhimurium*, *Saccharomyces cerevisiae*, and *Schizosaccharomyces pombe* indicate that CARNITOR® (levocarnitine) is not mutagenic. Long-term animal studies have not been conducted to evaluate the carcinogenicity of the compound.

PREGNANCY

Pregnancy Category B.

Reproductive studies have been performed in rats and rabbits at doses up to 3.8 times the human dose on the basis of surface area and have revealed no evidence of impaired fertility or harm to the fetus due to CARNITOR®. There are, however, no adequate and well controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

NURSING MOTHERS

It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

PEDIATRIC USE

See Dosage and Administration.

ADVERSE REACTIONS

Various mild gastrointestinal complaints have been reported during the long-term administration of oral L- or D,L-carnitine; these include transient nausea and vomiting, abdominal cramps, and diarrhea. Mild myasthenia has been described only in uremic patients receiving D,L-carnitine. Gastrointestinal adverse reactions with CARNITOR® (levocarnitine) Oral Solution dissolved in liquids might be avoided by a slow consumption of the solution or by a greater dilution. Decreasing the dosage often diminishes or eliminates drug-related patient body odor or gastrointestinal symptoms when present. Tolerance should be monitored very closely during the first week of administration, and after any dosage increases.

Seizures have been reported to occur in patients with or without pre-existing seizure activity receiving either oral or intravenous levocarnitine. In patients with pre-existing seizure activity, an increase in seizure frequency and/or severity has been reported.

OVERDOSAGE

There have been no reports of toxicity from carnitine overdosage. The oral LD_{50} of levocarnitine in mice is 19.2 g/kg. Carnitine may cause diarrhea. Overdosage should be treated with supportive care.

DOSAGE AND ADMINISTRATION

CARNITOR® (levocarnitine) Tablets.

Adults: The recommended oral dosage for adults is 990 mg two or three times a day using the 330 mg tablets, depending on clinical response.

Infants and children: The recommended oral dosage for infants and children is between 50 and 100 mg/kg/day in divided doses, with a maximum of 3 g/day. Dosage should begin at 50 mg/kg/day. The exact dosage will depend on clinical response.

Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution.
For oral use only. **Not for parenteral use.**

Adults: The recommended dosage of levocarnitine is 1 to 3 g/day for a 50 kg subject, which is equivalent to 10 to 30 mL/day of CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 1 g/day, (10 mL/day), and be increased slowly while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

Infants and children: The recommended dosage of levocarnitine is 50 to 100 mg/kg/day which is equivalent to 0.5 mL/kg/day CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 50 mg/kg/day, and be increased slowly to a maximum of 3 g/day (30 mL/day) while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution may be consumed alone or dissolved in drink or other liquid food. Doses should be spaced evenly throughout the day (every three or four hours) preferably during or following meals and should be consumed slowly in order to maximize tolerance.

NO APOLOGIES FOR RITALIN

No Apologies For Ritalin ◦ By Vidya Bhushan Gupta, MD ◦ EP8012AD- $19.95

Despite its name, No Apologies for Ritalin is aimed at educating parents of children with ADD by presenting all the treatments available for the disorder.

The first half of the book is a look at what ADD is: the medical aspects, how it is diagnosed, and what causes it. Anecdotes of children diagnosed with the disorder and a discussion of how doctors arrive at their diagnoses begin the book. Issues that parents must deal with, such as understanding and coming to grips with the diagnosis of ADD, whether ADD is a product of bad parenting style, ADD's occurrence with other disorders, and who is most at risk are discussed in this section as well.

Section 2 presents the pros and cons of all treatment options, both conventional and alternative, including non-drug therapies such as psychotherapy and behavior modification. The author, Vidya Bhushan Gupta, MD, MPH, FAAP, writes in his Foreword, "I have discussed the controversy surrounding the use of Ritalin and tried to dispel myths surrounding ADD and Ritalin: 'ADD is not a disease; it is simply a difference of temperament;' 'ADD is due to poor parenting;' 'Ritalin is a mind-altering drug like speed;' 'Don't give Ritalin to your children because they will get hooked on it.'" He explains that his purpose for writing the book is so that "parents of children with ADD will not blame themselves for their child's predicament and will be able to use all the available treatments, including Ritalin, without guilt."

The book offers insights into other issues regarding ADD as well, including: who should treat the disorder and what the goals of that treatment should be; suggestions for parents on dealing with their child's ADD; whether children grow out of their ADD; and how to de-emphasize the negative labels of the disorder by recognizing and building on the strengths of children diagnosed with it.

Patient Persistence ◦ By Adele M. Gill ◦ EP8004GN-$19.95

Patient Persistence celebrates the ability of people to overcome obstacles to achieve their goals. Author Adele Gill invited individuals from every background to tell their stories of "hope, courage, hard work, and endurance related to health, disability, relationships, family, ministry, career, accomplishment and challenge."

Ms. Gill is a certified disability analyst/fellow with the American Board of Disability Analysts, and an advocate of inspirational/motivational self-help. She writes, "Patience and persistence are qualities that are vital to the discovery of our finest, God-given gift; the resilient 'Indelible Human Spirit.' These innate qualities propel people and enable them to do great things and overcome significant hurdles."

Patient Persistence is both motivational and inspirational, offering help and hope to anyone who feels that his or her life is out of control, or that things have gotten so bad that there will never be a way to make it better.

Both of these books are available through the EP Library by calling 1-800-535-1910, or by visiting the Website at www. eplibrary.com

Finally, there is a truly portable assistive reading technology that reads words aloud and can be used ANYWHERE!

Readingpen *II*™

The perfect solution for educational needs!

For persons with reading difficulties, learning disabilities and dyslexia

- **SCAN a word(s) from printed text**
- **SEE the word displayed in large characters**
- **HEAR the word read aloud from built-in speaker or earphone**
- **DEFINE the word and hear it spoken aloud**

- Scans and speaks word or full line of text
- Displays and speaks the dictionary definition
- Spells the word out loud
- Displays syllables
- Recognizes printed fonts (6-22 points), **bold**, *italic*, underlined, hyphenated, and inverted text
- Adjustable for left and right-handed users
- Keeps a history of the last 80 words scanned
- Contains over 200,000 definitions from the American Heritage College Dictionary 3rd Edition
- Ergonomic 6" x 1 1/2" x 1" and lightweight (only 3 oz.)
- An Opticard lets you input text manually

FAMILY VOICES STATE CONTACT LIST

Family Voices is a national grassroots network of families and friends speaking on behalf of children with special health care needs. The principles of Family Voices are as follows. Every child deserves quality primary and specialty health care that is affordable and within geographic reach. Families are the core of this nation's health system, their children's most important health providers and caregivers. Quality health care is family-centered, community-based, coordinated, and culturally competent.

Family-centered health benefits and services are flexible, and guided by what children need. Strong family-professional partnerships improve decision-making, enhance outcomes, and assure quality. Families practice cost-effectiveness and expect the same from our health systems and services. Members of the Network serve on local, state and national boards and task forces. Often times members are staff for state health agencies or parent organizations, advisors to private and public health systems and research projects. The mission is to bring the family perspective to policy discussions and decisions. Listed below by state and US Territories are the Family Voices Coordinators or Chapter Representatives. For additional information, contact Family Voices National Office at phone: (888) 835-5669 or (505) 872-4774; e-mail: kidshealth @familyvoices.org; Web site: http://www.familyvoices.org.

STATE PROTECTION AND ADVOCACY AGENCIES FOR PERSONS WITH DEVELOPMENTAL DISABILITIES, MENTAL ILLNESS AND THE CLIENT ASSISTANCE PROGRAM (P&AS)

State Protection and Advocacy (P&As) offices are federally mandated to provide legally based advocacy services to people with disabilities in each state and territory. P&As primarily advocate on behalf of special education students through funds from two federal programs—Protection and Advocacy for People with Developmental Disabilities **(PADD)** and Protection and Advocacy for Individual Rights **(PAIR)**. These two programs join two other programs—Protection and Advocacy for Individuals with Mental Illness **(PAIMI)** and the Client Assistance Program **(CAP)**—to complete the entire P&A System.

P&As all over the country work on a variety of cases with common themes for people with disabilities, one of which is ensuring that children in special education are receiving the services to which they are entitled under IDEA. The P&A System provides a unique and effective resource for disability rights advocacy and education. People with disabilities, their family members, and representatives are encouraged to make use of these services. Consistent with available resources and priorities established by the community, the P&A will make every effort to provide appropriate assistance to remedy the situation.

For additional information about the P&A System, including the location of all P&As nationwide, contact the National Association of Protection and Advocacy Systems (NAPAS), telephone (202) 408-9514 (Voice) or (202) 408-9521 (TDD); or visit their Web site: http://www.protectionandadvocacy.com. For information about an individual case or local resources, see the following directory of state listings.

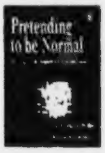
ANGELMAN SYNDROME

Angel Lady
Ashleigh Evans; Alice Evans
Whitney a beautiful, lively, affectionate child disabled by Angelman Syndrome is christened "Angel Lady" by her family. Unable to speak, the family through "Angel Lady Talk" devised a way to communicate. Light-hearted, optimistic and truly inspirational book.
AS100AS **$12.95**

Angelman Syndrome From A to Z
Second Edition
Alice Evans and Julie Hyman
A compilation of tips, hints, and ideas on how to survive and enjoy daily life with a child with Angelman Syndrome. The collection of ideas come from parents, teachers, siblings and care givers of people with Angelman Syndrome from around the world.
AS400AS **$18.95**

ASPERGER SYNDROME

Social Facilitation in Action
A Behavioral Intervention Therapy for Individuals with Autism, Asperger's Syndrome, and Other Related Syndromes
Ilana Katz and Andrew Yellen, PhD
This book provides concrete examples that many children with autism and Asperger's syndrome will encounter in their lives. It uses these examples to show exactly how social facilitation helps these youngsters operate in social situations and understand how society functions.
RL8151AS **$39.95**

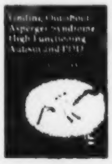


Pretending to be Normal
Living with Asperger's Syndrome
Liane Holliday Willey
This book peers under the umbrella of autism and looks at AS, a relatively new less debilitating autism-related diagnosis. Although first discovered in 1944, not much information has become available until the early 1990s with the establishment of a diagnostic criteria set forth by Gillberg and Gillberg. Here is shown that AS individuals are a bright thread in the tapestry of life and our civilization would be extremely dull and sterile if we did not have and treasure individuals with the condition.
TF250AS **$17.95**

Just This Side of Normal
Glimpses into Life with Autism
Elizabeth King Gerlach
This mothers story captures the challenges of raising a child with autism. She can touch her son, Nicky, but not connect with him; hear but not understand his chanted phrases. Yet she embraces life—the joy and sorrow, hope and despair, frustrations and fear without flinching. This story testifies to the power of a heart that has broken wide open.
FL101AT **$19.95**

Eating an Artichoke
A Mother's Perspective on Asperger's Syndrome
Echo R. Fling
A five year history of a mother, her family and Tim, her son, giving specific accounting of her thoughts and feeling as she struggled to find answers and cope as she raised her children. This book is not an end-all on the subject of raising children with AS but is meant to provide knowledge and understanding of a condition for which little information is available.
TF251AS **$17.95**

Asperger's Syndrome
A Guide for Parents and Professionals
Tony Atwood
This book provides a description and analysis of the unusual characteristics, and practical strategies to reduce those that are most conspicuous or debilitating. There are numerous quotations form people with Asperger's Syndrome, as their insight and descriptions are more clearer and more poignant that the text in scientific journals. This is in layman terms with very little scientific terminology to impress or confuse the reader. Topics covered are: Diagnosis; Social Behavior; Language; Motor Clumsiness, Sensory Sensitivity and much more.
TF252AS **$18.95**



Finding Out About Asperger Syndrome, High Functioning Autism, and PDD
Gunilla Gerland
A must read for all young people who receive a diagnosis of Asperger Syndrome, PDD, or High Functioning Autism. Written by an adult who was diagnosed at a young age with Asperger Syndrome, the book relates to young people, their peers, and their parents so all can better understand the person with the Syndrome.
TF8401AS **$9.95**

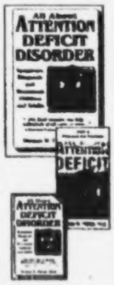
ASTHMA

The Lion Who Had Asthma
Jonathan London
Pictures By Nadine Bernard Westcott
Sean roars like a lion. But the lion who is Sean has asthma, and suddenly it's hard for him to breathe. The whole family pitches in to help deliver the treatment, and soon Sean is King of the Jungle again.
AW5597AM **$14.95**

I'm Tougher than Asthma
Alden R. Carter
and Siri M. Carter
with photographs by Dan Young
A terrific introduction for youngsters to the causes and controls used for Asthma and the discomfort that accompanies it.
AW4749AS **$14.95**

All About Asthma
William and Vivian Ostrow
An effective and friendly tale of one boy's problems with asthma and how he combats them when they occur. With fun illustrations to help the information be more understandable.
AW2766AS **$13.95**

ATTENTION DEFICIT DISORDER



All About Attention Deficit Disorder
Symptoms, Diagnosis and Treatment: Children and Adults
Thomas W. Phelan, Ph.D.
This comprehensive guide, available in book, video set, or audio tape format, gives parents and professionals the information and resources they need to effectively deal with ADD. Includes the most recent developments in ADD research regarding: basic symptoms; effects on school, work, home social life; seven indicators to predict the future; how to treat through counseling, school intervention, behavior management and much more

CM135AD (Book)	**$12.95**
CM140AD (Part I Video)	**$29.95**

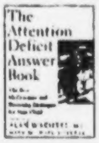
CM144AD (Both Videos)	**$49.95**
CM145AD (Audio)	**$24.95**



The Attention Deficit Answer Book
The Best Medications and Parenting Strategies for Your Child
Alan Wachtel, MD
with Michael Boyette
This text, written in question and answer format, suggests behavioral techniques, psychological interventions, and school modifications that treat the medical condition as well as the personal, emotional, and social issues arising due to ADHD.
CP176AD **$10.95**

No Apologies for Ritalin
Vidya Bhushan Gupta, MD
This book takes an in-depth look into attention deficit disorder (ADD) and the controversies surrounding treatment. Its purpose is to educate parents of children with ADD about various therapies available, so that they can make informed decisions about the better treatment for their child or young adult. Dr. Gupta hopes that parents of children with ADD will not blame themselves for their child's predicament and will be able to use all available therapies and treatment options, including Ritalin, without guilt.
EP8012AD **$19.95**

No One to Play With
Social Problems of LD and ADD Children
Betty B. Osman, Ph.D.
One of the first books that recognizes and provides advice on how to cope with the social difficulties encountered on an everyday basis by those with learning disabilities and attention deficit disorders.
AT100LD **$15.00**

TAKING CHARGE OF ADHD

The Complete, Authoritative Guide for Parents

RUSSELL A. BARKLEY PH.D.

This revised edition has been updated to incorporate the most current information on ADHD and its treatment. Includes a step by step plan for behavior management; New strategies that give children greater chances of success at school and in social situations; Practical advice for parents on managing stress and keeping peace in the family plus much more.

GL5606AD **$18.95**

WILLIE

Raising and Loving a Child with Attention Deficit Disorder

ANN COLIN

A candid, compelling story of one child, one family, living day to day with ADD, even as they learn to recognize and understand it. Written from a mother's perspective, this uplifting story will surely give hope to many parents who are trying to help their children.

GP177AD **$12.95**

UNLOCKING POTENTIAL

College and Other Choices for People with LD and AD/HD

JULIANA M. TAYMANS, PHD, LYNDA L. WEST, PHD, AND MADELINE SULLIVAN, M.A.

This book is an indispensable tool for high school students with learning disabilities who are preparing for life after graduation. Filled with the latest information, advice, as well as practical tips and resources, this book is designed to make the transition from high school a success.

WB9948AD **$18.95**

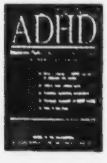
A NEW LOOK AT ADHD

Inhibition, Time, and Self-Control

RUSSELL A. BARKLEY

This video and companion manual provide an easy to understand introduction into one of the most influential theories on the nature and origins of ADHD. Also includes a leader's guide that provides tips on the optimal use of the video with a variety of audiences.

GL4979AD **$99.00**



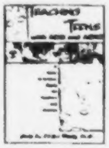
ADHD

Attention Deficit Hyperactivity Disorder in Children and Adults

PAUL H. WENDER, M.D.

This easy to read book for parents, families, and professionals is based on over three decades of research and personal experience in treating affected children and adults with ADD. It is a thorough review of the characteristic features, causes, co-occurring conditions, developmental course, and presentation in adulthood.

OU3489AD **$25.00**



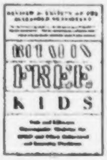
TEACHING TEENS WITH ADD AND ADHD

A Quick Reference Guide for Teachers and Parents

CHRIS A. ZEIGLER DENDY, M.S.

Recognizing the pivotal role teachers play in the long-term success of their students, this book provides information via 75 concise summaries on key issues related to attention deficit disorder. Beyond the thorough review of the basics, this guide also illustrates how the characteristics of the disorder can affect academic performance while presenting strategies interventions and tips to make teacher's jobs easier.

WB7208AD **$18.95**



RITALIN FREE KIDS

Safe and Effective Homeopathic Medicine for ADHD and Other Behavioral and Learning Problems

JUDYTH REICHENBERG-ULLMAN, N.D., M.S.W., AND ROBERT ULLMAN, N.D.

This book describes another approach—one that respects and takes advantage of the diversity of people with symptoms of ADHD; an approach that stimulates the unique adaptive mechanisms each person carries within. Homeopathy is a system of medicine that is highly individualized and can help people move toward optimal health. The case examples in this book demonstrate that, when used alone or as a complement to conventional therapies, homeopathic medicines can improve the function of people with ADHD to the point where conventional medicines are often no longer necessary.

AUTISM

THE SIEGE

A Family's Journey into the World of an Autistic Child

CLARA CLAIBORNE PARK

At age two, Jessy Park was remote, withdrawn, unable to walk or talk, oddly content within the invisible walls that surrounded her. Doctors were baffled. The study of autism was still in its infancy. Jessy's family stepped in. Confronted with the child's refusal of life, all existential hesitations evaporate, They had no choice. They use every stratagem they could invent to assail her fortress, to beguile, entice, seduce her into the human condition. This is a powerfully moving book that is now regarded by many as a classic work as it charts a surprising journey of discovery as it records the challenges and rewards of the first eight years of Jessy's life.

LB0694AT **$15.95**

THINKING IN PICTURES
TEMPLE GRANDIN

THINKING IN PICTURES

My Life With Autism

TEMPLE GRANDIN WITH A FOREWORD BY OLIVER SACKS

The author is a gifted animal scientist who has designed one third of all the livestock-handling facilities in the US. She is also autistic, a woman who thinks, feels, and experiences the world in ways that are incomprehensible to the rest of us. In this unprecedented book, the author delivers a report form the country of autism. Writing from the dual perspectives of a scientist and an autistic person, we learn how the country is experienced by its inhabitants and how she managed to breach its boundaries to function in the outside world. What emerges is a document that sheds light on the riddle of our common identity.

RH118AT **$12.00**

CHILDREN WITH AUTISM

CHILDREN WITH AUTISM

Diagnosis and Interventions to Meet Their Needs

BEHAVIOR

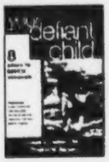
Defiant Children: A Clinician's Manual for Assessment and Parent Training

Second Edition

Russell A. Barkley, Ph.D.

Updating and expanding the first edition, this remarkably clear and effective manual includes, in a single spiral bound volume, a thorough clinical guide to Dr. Barkley's 10 session parent training program, a fully rewritten assessment section that incorporates DSM IV diagnostic criteria, and reproducible parent handouts reinforcing each step of the program. Special features include: Overview of program's purpose and goals and extensive outcome documentation, step by step instructions for each parent training session, A new home based reward system to improve school behavior plus much more.

GL1236BM	**$35.95**
GL2267BM-SPANISH	**$35.95**



Your Defiant Child

8 Steps to Better Behavior

Russell A. Barkley, Ph.D. and Christine M. Benton

Every child has "ornery" moments, but more that 1 in 20 American children exhibit behavioral problems that are out of control. If you are struggling with an unyielding or combative child, this book offers you the understanding and guidance you need. The book contains a clear explanation of what causes defiance, when it becomes a problem, and how it can be resolved. The comprehensive eight step program emphasizes consistency and cooperation, promotes changes through a system of praise, rewards, and mild punishment. Filled with practical charts, questionnaires, and check list which help you get your child's behavior back on track.

GP3212GN **$15.95**

Defiant Teens

A Clinician's Manual for Assessment and Family Intervention

Russell A. Barkley, Gwenyth H. Edwards, and Arthur Robin

This manual presents an 18 step program designed both to teach parents the skills they need to manage difficult adolescent behavior and to improve family relationships overall. Steps 1 through 9 modify the approach presented in "Defiant Children" to focus on developmental concerns of adolescence. Steps 10 through 18 are conducted with parents and their teenagers together, utilizing a family therapy model developed by Arthur L. Robin and Sharon Foster. Clinicians are shown how to help all family members learn to negotiate, communicate, and problem solve more effectively, while facilitating adolescents' individuation and autonomy. Reproducible forms enable clinicians to gauge nature, diversity, and severity of conflicts; assess for oppositional defiant disorder; and evaluate parental psychological adjustment. Also reproducible handouts for families to reinforce session ideas and concepts.

GL4405BM **$35.00**

1-2-3 Magic: Effective Discipline for Children 2-12

Dyslexia, Fluency, and the Brain
Maryanne Wolf
Consider the time it takes for the brain to process written language. What impact does the brain's processing time have on reading, development? What are the relationships among processing time, reading fluency, and dyslexia? Can time and fluency related problems be changed? How should intervention be designed to address the issue? This monumental resource presents evidence indicating that many dyslexic children have a second core deficit in rate of processing linguistic differences in multiple areas. This book has been constructed to bring several levels of evidence and types of research to bear on these questions.
YP2602DY **$30.00**

EPILEPSY

Epilepsy: The Facts

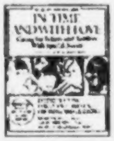
PE181MR $ 44.00

PARENTING

Special Children Challenged Parents
Robert A. Naseef, Ph.D.
The Struggles and Rewards of Raising a Child with a Disability
When a child is born, family life changes forever. If that child has special needs, the changes can seem overwhelming. What are the daily blessings and challenges that await parents when their child is not who they expected? How can they deal with their complex emotions, build a relationship with their special child, and maintain family unity? Dr. Naseef, a professional psychologist and father of a son with autism, answers these critical questions with keen insight and honesty.

PB5354GN $21.95



In Time and With Love
Caring for Infants and Toddlers With Special Needs

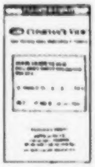
POTTY LEARNING

The Potty Chronicles
A Story to Help Children Adjust to Toilet Training
Written and Illustrated by Annie Reiner, L.C.S.W.
The book expresses children's common fears and therefore enables them to gain comfort and trust in the knowledge that their parents understand what they are experiencing. This understanding will help a child through this difficult stage.
AP121YP $8.95

Once Upon A Potty
Alona Frankel
Learning to use the potty is often a lengthy process, taxing the patience of both parent and child. When success finally comes—and it should come in its own good time without undue pressure or haste—it enhances the child's confidence and pride. This illustrated story for children is best used as a companion volume to a child's new potty to provide encouragement.
NC321YP (For Boys) $5.95
NC322YP (For Girls) $5.95



Potty Learning For Children Who Experience Delays
S.R. Hays, M.S. R.N., C.R.R.N.
This video presents a unique developmental approach to supporting the child in learning independence in the management of "bathroom" skills.

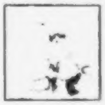
Let's Talk About It: Extraordinary Friends

Fred Rogers

This book lays the foundation for helpful talk and careful listening in any family. If children can learn to talk about their feelings when they are young, they can take that gift with them throughout their lives. Fred Rogers, of Mister Roger's Neighborhood, authors this exceptional text for children and parents.

GP1463YP **$16.99**



What's Wrong With Timmy

Maria Shriver, Illustrated by Sandra Speidel

All children ask questions that are difficult to answer. What then is the best response when a child points out that a disabled child or adult looks and acts "different"? In this book, remarkable for its sensitivity and generosity of spirit, Maria Shriver uses her story telling art to provide some answers. With a special insight that derives from her and her family's involvement with the rights of the disabled, the author deepens our understanding as she introduces us to a terrific kid named Timmy, someone who wants what we all want—to be included and loved.

Universal Newborn Screening

In 1961, Dr. Robert Guthrie of the University of Buffalo developed a laboratory test to detect phenylketonuria (PKU) in newborns. PKU is an inherited metabolic disorder resulting from an enzyme deficiency; if left untreated, it results in profound mental retardation. In 1963 Massachusetts became the first state to mandate screening for PKU, which can be treated by lifelong dietary management and counseling. The National Association for Retarded Children (now The ARC), the Children's Bureau and the Kennedy Foundation were foremost among the organizations that pushed for widespread adoption of the Guthrie test, and by 1966 it was required for all children by all 50 states and the District of Columbia.

Dr. Guthrie and other researchers continued to develop newborn screening (NBS) tests to detect many more disorders, and each state decided what screens would be available for its newborns. Significant disparities resulted; in 1997, in Massachusetts, infants were tested for 10 or more disorders, while Utah's babies were screened for three. Montana and South Dakota each mandated three tests and offered one other by special request only. In the same period, with the introduction of ever-smaller and more powerful microprocessors, technology and equipment became significantly more sophisticated. This permitted testing that had not been feasible before. A process called tandem mass spectrometry (tandem MS, MS/MS) can now run tests for nearly 40 disorders at one time. None are curable, but all are treatable.

In the last two years, many states have expanded their NBS programs. Almost all Pennsylvania hospitals now offer the full spectrum of testing, although the law mandates testing for only six. Massachusetts routinely screens for more than 15 disorders and is running a pilot program offering 30+ tests. Wisconsin has almost tripled availability, from 7 tests to 20. Yet universal NBS still engenders much controversy, and there are many issues to be resolved before consensus can be reached on how the US will move forward.

The data tells us that of the four million babies born in the US each year, ten to twelve thousand may have one or more of these detectable...and treatable...disorders

ISSUES: These may be economic, political, professional, sociocultural, religious. Capital spending, training, payment policies, long-term follow-up; insufficient hard financial data; union issues; professional knowledge levels and practice habits; citizen knowledge, and cultural and religious beliefs and practices; insurance, managed care companies, Medicaid, ChIP programs, the uninsured–all these and many more must be part of discussions and resolution.

With the current system, a child born in Louisiana with galactosemia will likely live a life marked by mental retardation and other special health care needs, while similarly affected children born the same day in most of the rest of the country will receive immediate treatment and become productive members of society. The data tell us that of the four million babies born in the US each year, ten to twelve thousand will have one or more of these detectable disorders, an almost-negligible number. The overall cost or benefit to our society, though, will vary wildly from one child to another because of the patchwork of screening availability. We as a nation must find a way to embrace universal NBS and make it routine for all children born in the US. More than that, it is downright wrong not to do so when it has proven its worth time and again!

It is a question of education and awareness. Research shows that the average couple planning to have children does not know anything about existing screening programs, much less the capabilities offered by tandem MS, largely because OB/GYNs, pediatricians, genetic counselors and related professionals are not familiar with universal NBS. The education gap relates to professionals and consumers, rich and poor, people of every race, religion and ethnicity. Few people know much about any of the issues. Worse, among the people who do profess knowledge of NBS and the issues, a good deal of what they "know" is wrong.

The information you need on Newborn Screening is finally available on DVD and video

CHILDREN AT RISK
The State of Newborn Screening
Call for Special Introductory Price
DVD
VHS

Children at Risk:

The State of Newborn Screening

is now available on DVD and VHS. Introducing the first in a series of special educational programs presented by EP and the EP Foundation for Education, Inc., a 501(C)3 Not For Profit Corporation.

EP Foundation for Education, Inc. **Child Neurology Society** EP

Newborn screening can detect up to 39 metabolic disorders from one blood spot. All are treatable when diagnosed at birth, offering the chance for a full and productive life.

Leading medical and scientific professionals are gathered to provide the most current information available. You can view this valuable resource at your convenience and the DVD is indexed so that key topics are easily accessible.

FEDERATION OF FAMILIES FOR CHILDREN'S MENTAL HEALTH

State Organizations, Chapters & Representatives Contact List

Throughout America, there is awakened awareness of the struggles, challenges, and untapped possibilities for children and adolescents with mental health needs. Effective family-driven advocacy ensures that children's mental health remains a highly visible, national priority. The Federation of Families for Children's Mental Health serves, with humility and determination, to provide and sustain leadership for a broad and deep nationwide network of family-run organizations.

We harness the passion (and we honor the cultural diversity) of our national membership and help focus it as a potent force for change in behalf of children with mental health needs and their families. We are passionate advocates at the national level for the rights of these children and families. We are equally passionate in transferring our insights and experiences to statewide family organizations, local chapters, and other family-run organizations so that skillful and effective advocacy can occur at state and local levels as well. We extend a lifeline to this network so that our partner organizations might draw strength from us and, in turn, better respond to the needs of families requiring guidance, training, support, and personal advocacy. Through our evolving relationships with these organizations, we jointly discover and share new models, new technologies, new tools, and new visions that enrich the capacities of our partners, strengthen our network, and allow us to serve with pride in this leadership role.

HOW TO USE THIS DIRECTORY

This directory includes the addresses and phone numbers of these projects. When available, e-mail addresses are indicated by the symbol ✉. Web sites are listed with the the standard **http://** before each. (Unless otherwise indicated, all telephone numbers are for voice only.) ✆ = Call before faxing. State Organizations (denoted by the symbol ◆) are statewide family-run organizations focused solely on the needs of children with mental health issues and their families. CHAPTERS (denoted by the symbol ○) are local family-run organizations with a similar focus.

VOCATIONAL REHABILITATION PROGRAMS

Vocational rehabilitation assists people with disabilities in preparing for, beginning, and keeping employment. One of the oldest programs in which state funds are matched by federal funds, vocational rehabilitation began in 1920, with the passage of the Civilian Vocational Rehabilitation Act, which encouraged states to provide rehabilitation services to disabled veterans. Today, vocational rehabilitation programs operate under the Rehabilitation Act of 1973 and its subsequent amendments. Following is a listing of state vocational rehabilitation services.

THE MELMARK SCHOOL

2600 Wayland Road, Berwyn, PA 19312 ◆ 1-888-MELMARK ◆ Fax (610) 353-4956 ◆ www.melmark.org

Our approved private day and boarding school serves children ages 5-21 who have:

- Autism/Pervasive Developmental Disorders/Asperger Syndrome
- Aquired Brain Injuries
- Celebral Palsy
- Mental Retardation
- Neurological Disorders

Situated on an 80-acre country campus, Melmark's goal is to maximize independence through "best practices" in Applied Behavior Analysis, functional curriculums, vocational training and collaborative services.

We Offer Your Child:

- Low Student/Teacher Ratios
- Applied Behavior Analysis
- Functional Communication Skills
- Adaptive Physical Education, Aquatics, and Therapeutic Horsemanship
- Physical, Speech and Occupational Therapy
- On-Site Physicians and 24-Hour Nursing
- Psychological and Family Support

To arrange a personal visit, request a brochure or video, contact Peter McGuinness, Director of Admissions, at 1-888-MELMARK Ext. 636 or email admissions@melmark.org

Early Childhood

EP
EARLY CHILDHOOD

19 Daycare for a Child with a Disability: Who Is Fighting for You?
by Gale Jurasek
Although the Americans with Disabilities Act (ADA) prohibits discrimination based on disability, parents of children with special needs are often faced with this problem when seeking daycare.

24 Reader's Talk
Our readers share their experiences of searching for inclusive daycare.

34 The Benefits of Early Intervention
by Marie Baughman
A parent shares her experience with early intervention.

38 WCD Scrapbook
A review in pictures of the 2000 World Congress & Exposition on Disabilities.

52 Special Report: Parents as Partners in the Medical Home, Part 5
by Karen Burstein, PhD, and Tanis Bryan, PhD
The Family-Centered Medical Bill of Rights

62 Family Circle: Support for Parents
Tips for relieving parent stress.

66 La Fundación John Langdon Down , A.C.
This organization, based in Mexico, educates and supports children with Down syndrome and their families.

67 Picky Eater? Don't Give Up ... Yet
How to introduce new foods to your finicky child's diet.

MARCH
Medical Research Update

24 Pediatric Clinical Trials
by Rebecca Clay
Testing new medications on adults is required for drug approval by the FDA. But what are we doing to ensure that these medications are safe for our children?

30 Never Give Up Hope
by Joe and Marlene Vechina
A family leaves no stone unturned to find treatment for their son with Wilson's disease.

42 Cyber Summer Camp
by Lucinda M. O'Neill
CAST's Internet camp keeps kids busy during the long days of summer.

46 Happy Camping
by Jacqueline Gieri
"It is so exciting for the campers not to be the outsiders for once."

50 HASC Summer Program
A blend of school and camp, HASC keeps children with multiple and severe disabilities from falling behind academically during summer, and at the same time, involved in much-needed fun, and recreation.

56 Camping out, Fitting in
by Kerry Pianoforte
Teens with physical disabilities discover a lot about themselves at the Shake-a-Leg camp.

59 Princeton Language & Speech Center
by Lauren Agoratus
Finally, a mother finds a camp for her daughter, who has both behavioral challenges and a medical condition.

60 Camp Loyaltown
by Sarah Bernstein
A little sister with developmental disabilities returns home from summer camp with new interests, new skills, and a big sister takes notice.

APRIL
Mobility

28 Nuts and Bolts of Seating Systems
by Ginny Paleg
Advice on building a seating system from the bottom up.

30 Hope's Magic: Making Mobility a Reality
by Tonya Kimball
A camp for children with physical disabilities gets kids moving.

39 What You Should Know About the First Wheelchair
by Louise Kinross
Getting mobile is important in a child's development, and picking the right chair needs to be an informed decision.

48 Taking Care of Their Own
by Sgt. Angela C. Strong, USMC
A Marine sergeant and exceptional parent in need learns the meaning of the word "brotherhood."

54 Wheels for Children
by Cathy Mulholland, OTR
Two organizations bring mobility equipment to children in need around the world.

58 Recreational Therapy—Family Style
by Ann Allen
A mother of two children, one with a disability and one without, serves up a laundry list of outdoor activities a family can do together, without bulging the budget.

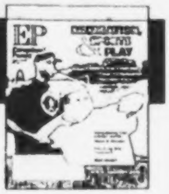
62 TEAMWORK— The Name of the Game at the Miami Children's Hospital Dan Marino Center
A pro-football legend gives back to the community.

67 Appealing Insurance Rejections
by Michelle L. Lange; OTR, ABDA, ATP
A well-worded letter of medical necessity from the rehabilitation team can make insurance companies think twice about denying coverage for a back-up wheelchair.

94 Promoting Health for Individuals With Mental Retardation
Special Olympics is spearheading an initiative to ensure that the healthcare needs of people with mental retardation are being met.

EDITORIAL INDEX 2001

MAY Recreation Sports & Play



20 SACC—Structured Athletics for Challenged Children
by Kim Wise
A sports program that gets all kids playing!

26 2001 Special Olympics World Winter Games
Showcasing a "can do" attitude on the global stage.

32 "It Can Be Done"
by Richard J. Young
A father tells how karate helped his son deal with his cerebral palsy.

34 Directory of Adaptive Recreation Organizations

36 The Ultra Stretch
by Christine Stopka, PhD, ATC/L, CSCS
A virtually effortless stretching technique that gives immediate results.

40 Navy Run Jump 'n' Throw Provides Inclusion for All Kids
by Jim Santos
This program allows young people with disabilities to participate in competitive sports with peers in school. Includes instructional tips for coaches and peers.

43 A New Light in Kaspi
by Darcy Kiefel
Young people with disabilities from an orphanage in Georgia (former Soviet republic) gain new insight learning to ski.

44 Don't Try This at Home!
by David Chamalian
Extreme Mike, a man of adventure, shows the world and his family that his disabilities pose no barriers to living his life on the edge.

47 Theater of Dreams: Showcasing the Talents of People with Disabilities
by Joel M. Levy, DSW
The YAI Players take the stage in performances of poetry, song, and dance.

52 Making Beautiful Music
by Karen E. Zielinski, OTR/L
You don't have to be a virtuoso—tickling the ivories can provide limitless opportunities for fun and learning.

55 The Water's Edge: A Story of Friendship and One Family's Battle Against MS
by Joseph M. Valenzano Jr., President, CEO & Publisher of EP magazine

71 Levels of Inclusion
by Therese M. Abrams
Tips on determining whether a group or program can provide an inclusive experience for your child.

JUNE Technology in Education

32 Thinking Readers–Helping Students Take Charge of Their Learning
by Lucinda M. O'Neill
A computer-supported learning strategy that integrates literature and reading comprehension software and student-teacher dialogue.

36 Working Together: People with Learning Disabilities and Computer Technology by DO-IT
Adaptive computer hardware and software to assist individuals with LDs in furthering their academic and career goals.

40 Hands On-Hands Off
by Deanna Lang
COTA/L Assistive computer technology for individuals with limited upper body strength.

44 Software for Learning, Part One: Choosing What's Best for Your Child
by James W. Forgan, PhD and Roberta K. Weber, EdD
With the Individualized Special Needs Software Evaluation Instrument, parents and educators can decide if a specific computer software program will be successful.

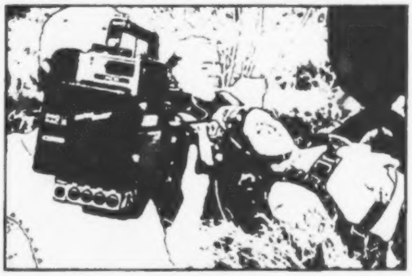
48 EP Survey—Top 5 Disability Sites
by Keith Hersch
Introducing a new column. This month's survey asks readers to send in a list of their "Top 5 Disability Web sites."

54 Helpful Hints for Getting Assistive Technology Devices and Services Through Your School District
by Pennsylvania's Initiative on Assistive Technology (PIAT).

60 Welcome to the World of IEPs–Ideas for Successfully Navigating the IEP Process
by Christina Goldstone
A mother shares her experience with her daughter's Individualized Education Plan (IEP):

65 Moving On
by Rich Kenney, MSW
The Foundation for Blind Children makes the transition to public schools easier for its young graduates and their parents.

70 Underwater Discovery
by David Chamalian
Scuba diving opens up a whole world to people of all ages and abilities.



76 Hitting the Road
by Gale Jurasek
John Keating, the father of a son with autism, is cycling across the US to raise awareness and fund research.

JULY Adolescence & Transitioning

20 Exceptional Parent's 30th Anniversary, Part II
We continue to highlight the thoughts of parents and professionals who care for children with disabilities, their opinions on the most important changes of the past three decades, and their impressions on what the future holds.

37 Driver's Education
by Randy M. Williams
A father explains why his daughter with ADHD should be allowed to get her driver's license.

40 Work-Based Learning: Students with Disabilities Succeeding in Education and Employment
by Michael Richardson
Tips for high school students on how to make themselves more attractive to potential employers.

46 Trying Their Wings: Youth with Disabilities Soar on Their Own
by Louise Kinross
A university-based program designed to teach young adults with physical disabilities some basic independence skills before heading off to college.

50 If Life Is a Journey, Make it a Joyride
by Rick Enright, BA, MSW
Advice to young people with physical disabilties on how to understand their bodies and achieve greater independence as a result.

52 High School and Beyond
by M. Sherril Moon, EdD, Meg Grigal, PhD, and Debra Neubert, PhD
How some alternative programs in Maryland for students aged 18 to 21 are providing special education services in settings other than high schools.

58 On Equal Ground
by Natalie Abbott
This teenager with Moebius syndrome talks about how her leadership qualities, NOT her disability, helped earn her a post with the California Governor's Committee for Employment of Disabled Persons' Youth Leadership Forum.

60 Software for Learning, Part 2: Choosing What's Best for Your Child
by James W. Forgan, PhD, and Roberta K. Weber, EdD
How to evaluate the utility of software for elementary-age children with learning disabilities, behavior disorders, or mild mental retardation.

94 State Developmental Disabilities Councils Directory
An updated listing of Developmental Disabilities Councils by state and US Territory.

AUGUST Healthcare

12 The Crisis in the Direct Support Professional Workforce
Finding, Keeping, and Training DSPs
by Amy Hewitt, PhD

26 It's 1 am, Do You Know Where the Third Shift Is?
by Ruth Toon

28 You Get What You Pay For—The Underfunded Mandate for DSPs
by John Rose

33 Breaking the Myth of Sisyphus
by Susan O'Nell
A parent's guide to understanding the DSP crisis.

38 Thoughts on Being a Professional Caregiver
by Patti Wade

40 Are You Gonna Be Here Tomorrow?
by David C. Pfriem

48 Educational Opportunities for Direct Support Professionals
by Amy Hewitt, PhD

52 "If You Build it, They Will Come"
by Marianne Taylor

56 Learning the Art of Direct Support
by Marianne Taylor

58 Loving the Ones You Love
by Robin Atwood

63 National Alliance of Direct Support Professionals Code of Ethics

66 Why Bother?
by Mike Cook
A Skeptic Shares His Thoughts on a Code of Ethics for Direct Support Staff

67 Going From Paper to Practice Teaching Ethics to DSPs
by David Chrisco

70 Exceptional Direct Support Professionals
A salute to direct support professionals who were nominated forrecognition for the exemplary care and support they provide.

79 Maybe It's Genetic...
What Kids Think of Their DSP Parents

80 Shawn and Patrick: A Self-Advocate and Direct Support Professional Partnership that Blossomed Into Friendship
by Shawn Raymer, Patrick Imel, and Judith Stevens

82 From Acquaintance to Partnership
by Mark Olson and Cliff Poetz

85 Profiles in Excellence
Compiled by the Irwin Siegel, Inc.

88 EDITORIAL COMMENTARY: The Case for Universal Newborn Screening
by Charles P. Hehmeyer
A call to action on the dire need for newborn screening nationwide

94 Waiting for Kimbi
by Patricia V. Wood
A mother's quest to help her daughter with Hallervorden Spatz syndrome led her to found an organization that promotes research into this rare disorder.

97 David's Story
by Linda Weiford
A mother writes about her family's journey with autism

101 Software for Learning: Part 3, Linking Software Evaluation to the IEP
by James W. Forgan,PhD and Roberta K. Weber, EdD and Gale Jurasek

EDITORIAL INDEX 2001

SEPTEMBER
Education

22 Models of Excellence in Education
EP salutes exceptional educators and programs that have greatly contributed to inclusion in the classroom and community.

38 Integrated Preschool Classrooms: Learning Together and From One Another
by Ronald S. Lenkowsky, EdD
A look at preschool classrooms where children with and without disabilities are learning together without labels or distinctions.

44 Educating Children with Chronic Illness
by Ann G. Bessell, PhD
A mother and researcher fights for the right to an education for children who are in the fight of their lives against illness.

50 Need-to-Know Changes in IDEA
by Sara Pankaskie, PhD, and Shelly Weiss, EdS
Answers to questions that parents may have about related services as they apply specifically to transitioning from school to the community.

56 The Universal Learning Center
by Lucinda M. O'Neill
Helping Teachers and ParentsFind Accessible Electronic Learning Materials for Students with Disabilities

60 Everything You Always Wanted to Know About Related Services
by Beth Randall
They're Baaaack! Mothers from Hell 2 pokes fun at IEPs.

62 "Practice" Makes Perfect
by Syndee Kraus, Kelly Maxwell, and R.A. McWilliam
Research Looks at Family-Centered Practices in Early Elementary Grades

64 Preparing Students with Learning Disabilities for College: Pointers for Parents, Part 1
by Andrew V. Beale, EdD, and Melissa M. Ericksen-Radtke, MEd
Suggestions to assist parents in working to include college as an option for their children with learning disabilities. Part 1 covers elementary and middle school.

70 How the Click of a Mouse Changes Lives
by United Cerebral Palsy
A record-breaking online donation to UCP ushers in the age of "e-philanthropy."

74 Infantile Spasms–A Seizure Disorder of Infancy
by Matthias C. Kurth, MD, PhD
A case study and in-depth look at this often undiagnosed disorder.

79 Editorial Commentary: Current Topics in Newborn Screening: Political Issues
by John Sorrentino
A discussion of the current climate in Newborn Screening.

86 Sometimes It Takes a Village
by Jann Moore
A look at life in Annandale village.

105 The NPA Parent and Family Advocate Special Interest Group
by Mike Hynan, PhD

110 Annual Listing of Schools, Camps, and Residences

OCTOBER
Toys

20 The Serious Business of Play
by Gale Jurasek
Introducing toys tested and reviewed by parents, therapy professionals, and kids.

26 Toy Selections From Our Toy Reviewers
Our toy experts give us their picks for new toys as well as some true classics.

30 Accessing Fun
Readers' suggestions for toys, toy adaptations, and play time activities that work for their children.

30 Toys for Fun and Learning
by Eva Briggs

32 The Toy Doctor's Prescription for Play

34 Magnets Make Toys Attractive
by Louise Kinross

36 Ideas for Kids with Visual Impairments
by Debbie Carson

38 Jami's Toys
by Manuela de Goeij

38 Hooked on Books
by Jodi Prather

40 Spooktacular Costume Ideas
EP readers let us in on their secrets for great Halloween costumes.

52 Some Bright Ideas for Play with Your Child
by Debra Siegel
Tips for helping your child get the most out of play time.

54 Holiday Activities
by Debby Entwistle and Jo Ann Hughes
Directions for making beautiful masks—for Halloween or any time you feel festive!

56 Preparing Students with Learning Disabilities for College: Pointers for Parents, Part 2
by Melissa M. Ericksen-Radtke, MEd, and Andrew V. Beale, EdD
Suggestions to assist parents in working to include college as an option for their children with learning disabilities. Part 2 focuses on the high school years.

63 Challenging Healthcare and Winning at Special Olympics' Wellness Park
by Susan Carucio Colacello
Kids with special needs can get valuable health screenings from the professionals at Special Olympics' Wellness Park.

66 Attachment and the Child With Special Needs
by Dianne I. Maroney, RN
The importance of the physical and emotional bonds between infants and parents.

75 Hunt for an Elusive Gene
by Joanne and Rob Forstall (with Jennifer Cannataro)
Parents tell the story of their daughters' rare disease (BridgeMar syndrome) and their race against time to find the gene that causes it.

NOVEMBER Technology

24 Assistive Technology: A Success Story

by Garth Heid and Jeannette Van Houten

The AT team—including parents—follows a course of action to help a student with multiple disabilities acquire and use AT in school.

28 EP Survey—Top Disability Web Sites, Part 2

Results of the EP survey we introduced in June.

30 Affordable Recreational Equipment

by Rick Escobar

A rehabilitation technologist shares some ways to make adapted scooters and tricycles.

32 Innovative Web Sites Use the Internet to Breakdown Real Barriers

A look at what is offered on WheelchairNet and AbilityForum.com.

34 My Dog Ate My PDA

by Anne M. Bauer, EdD, and Mary E. Ulrich, EdD

A study of the use of personal digital assistants (PDAs), a new generation of handheld computers, in an inclusive classroom.

38 Popping the Clutch

by Kate Thomsen

A parent of a child with a learning disability talks about knowing when to help with schoolwork and when to let go.

44 Darwin's Nose Job

by Susanne Carter

A Story of Maternal Anxiety and Advocacy

By working as a team, parents and hospital staff can make the going easier for children with disabilities.

50 Coping With Disaster

by Anne Farrell, PhD, and Daniel Crimmins, PhD

A Guide for Supporting Children With Cognitive Disabilities

How to help your child weather traumatic times.

60 It All Begins in the Home

by Joseph M. Valenzano, Jr.

EP's publisher takes some time with author and advocate Maria Shriver about the importance of teaching children the right lessons.

66 Living with Prader-Willi: The "Starving Syndrome"

by Linda A. Thomas and Merlin G. Butler, MD, PhD, FACMG

DECEMBER Family, Friends & the Community

20 Siblings Speak Out

A group of young people get together and express their feelings about having a sibling with a disability.

22 A 21st Century Mission

by Lucinda M. O'Neill

The first CAST Institute on Universal Design for Learning helps educators learn how better to implement technology and the use of digital text in their classrooms.

26 Living with MPS: Mitch's Story

Members of the Moore family discuss their experience with Hunter syndrome.

30 Interview with Governor Jeb Bush

by Joseph M. Valenzano, Jr.

EP Publisher Joseph M. Valenzano, interviews Florida Governor Jeb Bush about his administration's efforts to help families and individuals who are living with disabilities.

34 Luz' Story: The Power of Family Love

by Luz Elena Aponte

The story of how the Aponte family got involved and made things happen.

38 Coping With Disaster

by Anne Farrell, PhD, and Daniel Crimmins, PhD, with Suzanne Bushby, MA, Monica Feinberg, PhD, and Dana Leonardi, PhDEPA

Guide for Parents and Other Caregivers

48 Hereditary Colon Cancer

by Beth Schreiber

A closer look at hereditary colon cancer and the effect on individuals and families dealing with the disorders.

52 WCD Roundup

A review in pictures of the 2001 World Congress & Exposition on Disabilities in Atlanta, GA.

62 Remembering Malki

A mother and a father write about Malka Chana Roth, their daughter who was murdered.

85 In Memoriam

Dr. Stanley Herr, a beloved advocate for individuals with disabilities, dies.

Your Family's Freedom is Here:

The Rear Entry Kneelvan.

The whole family fits: Kneelvan seats up to 7 people.
Scooters and chairs that won't fit in other vans can fit in a Kneelvan.
KneelVan
Kneelvan is the most reliable lowered floor minivan ever.
More ground clearance than any other lowered floor minivan.
Kneelvan's rear entry design can park anywhere, even in regular parking spots.

Designed with your family in mind, the **Kneelvan is simply the easiest way to travel**. Unlike side-entry conversions, we designed the rear entry KneelVan so you can **never get blocked by someone parking next to you**. Kneelvan is perfect for families with kids: its the best family van ever.

We would like to invite you to compare Kneelvan for yourself. Call today for more information and our free video.

Call Toll Free: 1-888-625-6335.

CANADIAN RESOURCES

This directory contains organizations dedicated to helping people dealing with disabilities throughout Canada. It is divided by province into the following categories: Community Living; Early Intervention; Education; Employment; Life Planning; Literacy; Outreach and Support; Specific Disabilities (see "National Specific Disabilities" starting on page 22 for more listings, including Canadian-based organizations); and Travel. We have categorized organizations according to the descriptions they provided on their surveys; however, some organizations provide many services that fall into more than one category. Other organizations provide services only for individuals with specific disabilities and their families, or to those who meet certain other criteria. We urge readers to contact organizations directly for more information.

USING THIS DIRECTORY

When available, e-mail addresses and World Wide Web sites have been included. E-mail addresses are indicated by the symbol ✉. Web sites are listed with the standard **http://** before each. (Unless otherwise indicated, all telephone numbers are for voice only.)

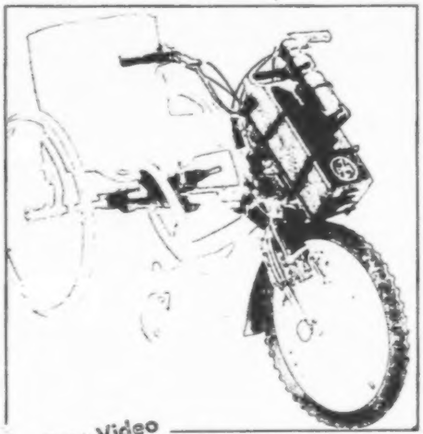
PT1000 PowerTrike™ Features

Makes a Great Gift!

Introducing the **PT1000 PowerTrike™** offered by **Harmar Mobility.** Simply connect the **PowerTrike™** to virtually any wheelchair and it turns into a powerful new form of electric transportation. A range of 15 to 20 miles between charges makes the **PowerTrike™** a useful tool for everyday tasks as well as a fun recreational vehicle. Firm sand, fields, offroad paths and other walkways are not only accessible but fun with the powerful and versitile **PowerTrike™**. Boldly go where few wheelchairs have gone before.

pdq®

PowerTrike™ owners enjoy the benefits of free membership to the pdq Club for one year. A pdq Club member automatically qualifies for free insurance to protect against accidental damage, theft and even a breakdown of the **PowerTrike™** and/or the wheelchair in addition to other benefits.



- Dual Front Brakes and Twist Throttle
- Digital Speedometer & Clock
- Speed up to 11 mph
- Quick Release Gel Battery
- 2 Speed Control Box & Battery Level Indicator
- Quickly and Easily attaches to Folding and Sport Chairs
- Powerful 150 watt brush motor
- 20" Wheel for Rough Terrain
- Range - 15 to 20 Miles per charge

Free Video available on VHS or CD ROM

For Family Freedom
Get a Superarm Lift

Handicaps, Inc.

- Quick installation
- Doesn't Block Door
- 3 Year waranty
  5 year limited
- Less Cost
- V.A. tested
- Load in seconds
- Less Parking Space

"We are absolutely delighted with the Superarm Lift. The major advantage is the ease and unobtrusiveness with which it mounts to the van. It is so much more attractive than the various elevator contraptions. The lift has increased our son's mobility by 100%. We enthusiastically recommend the Superarm Lift."
Mr & Mrs Crowl - Tulsa, OK

- **Fits full-size vans, RV's & some mini-vans *(ask us)***
- **Lifts Electric & Manual chairs *tell us if you have seat inserts***

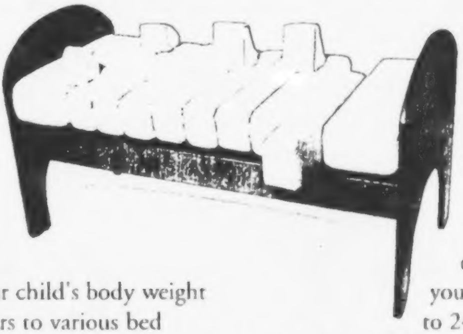
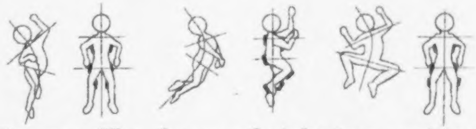
Nighttime Positioning You No Longer Have To Dream About.



Introducing Dreama™, a unique and innovative sleep system from Jenx that provides your child with better positioning throughout the night.

The Dreama™ concept utilizes a series of specially-compounded foam blocks that firmly position and support your child's body weight individually. The system contours to various bed frames and quietly adjusts to support the body in any position—supine, prone, and side lying. Dreama™ positions a child to prolong sleep patterns and prevent stiffness and aspiration.

Putting your child down for the night in Dreama™ extends the optimum positioning you achieved throughout the day to 24 hours. Give your child the relaxation and sweet dreams they need so much.



Dreama. The dream of nighttime positioning.

Multi-Sensory Environments

Let TFH (USA) . . . .
assist you in creating a **Multi-Sensory Environment** which can provide valuable therapy for individuals who have various sensory, cognitive, and physical disabilities. Provide your child with a unique sensory area that can bring **Relaxing, Stimulating,** or **Interactive** experiences into their life. Sensory environments can be uniquely designed for your child, or you can utilize TFH's mobile **VECTA** unit, which can easily transform a small room into a sensory area.

SING ALONG

TIME To SING!

Give the gift of song with *Time to Sing!* *Time to Sing!* is a newly arranged children's music CD with 26 of your child's favorite songs. The tempo is slowed down to enable children with speech and other disabilities to sing along. Preschool teachers, speech pathologists and parents agree: children *love* to sing with *Time to Sing!*

ABLEWARE®

KiD STUFF

Family Toilet Seat

The perfect seat for children and adults.

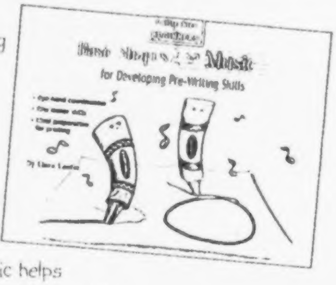
Features a child's seat, with a smaller opening, fitted between a standard adult toilet seat and lid. When not in use, the child's seat can be flipped up and nestled into the recess of the lid and it can be removed for easy cleaning or storing.

Fits all standard toilets.

F72620-0000 **$59.95**

U.S. Patent #4,461,046

Callirobics™ Handwriting Exercises - For Beginners



Basic shapes to music for developing pre-writing skills for children just starting to experiment with "writing" or for children with low developmental ability. Upbeat music helps to develop a comfortable rhythm.

Includes exercise guide and audiocassette of musical selections.

F71744-0004 **$22.35**

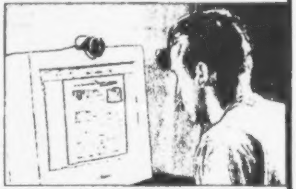
Life is now easier for people with restricted mobility.

Introducing miracle mouse™
The Ultimate Controller for People with Restricted Mobility

Get Complete Control of your Computer – Hands Free!



Clicking and double clicking are easy!

Miracle Mouse is the revolutionary headgear controller that gives people with mobility limitations complete control of their PC – hands free! Imagine being able to retrieve lists of words and phrases that can be inserted into any Microsoft application using a single head movement – *no switches or mouth-controlled devices required.* Miracle Mouse makes it easy for anyone to send and receive email, surf the Internet, word process, program a web site, play games, and more!

For more information or to buy now:

www.miracle-mouse.com • 866-875-5556 (Toll-Free)

Highlighted Features:

- Extremely accurate
- Adjustable sensitivity
- Customizable on-screen keyboard
- Lightweight with no moving parts
- Profiling software allows complete mouse emulation
- Works with other controllers and assistive products
- USB ready

Special needs patients require special supervision. But one-on-one care can sap the resources of the most dedicated caregiver. Seizures. Head-banging. Falls from bed. Wandering. They take their toll on a night's sleep—for the patient and the caregiver. A Vail Enclosed Bed System may be the answer.

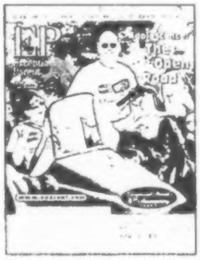
Exceptional
Parent

BOBBY APPROVED
Click here for our Text only site.

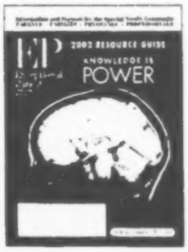


TOYS—The new eToys Web site (www.etoys.com) teams with EP's Web site, EParent.com (www.eparent.com) to offer ideas, information and imaginative toys for families with kids who have special needs. When parents, teachers or caregivers shop at eToys and visit the co-branded EParent.com site, they'll find hand picked toys and games, plus featured articles from EP Magazine. The site also features direct links to the EParent.com shop at eToys, and eToys products recommended by experts or reviewed by organizations chosen by EP Magazine.

EDUCATION—EParent.com's newly-constructed Education channel (EDU/TOYS tab) yields a wealth of current articles on topics such as IDEA, IEPs, assistive technology, transitioning and inclusion. These are supplemented by a growing directory of schools, camps & residences, which can be found in the "Directories" link of the "Resources" channel.

NOW SUBSCRIBE ON-LINE

ON-LINE ARCHIVES—Now, EParent.com users can preform keyword searches through our on-line archives and purchase articles which have appeared, as far back as in the eighties, in EP Magazine (recipient of awards from Folio:The Magazine for Magazine Management, Easter Seals, Consumer Healthcare Group). These include classic pieces on such subjects as early childhood, rare disorders, technology, education, medical research update, transitioning, travel, all of which have distinguished EP Magazine through the years.



MORE TO COME IN 2002—You can also click through our EP Library (www.eplibrary.com) which contains books, videos and software encompassing almost 50 specific and general categories, with more than 650 titles. Of course, we will continue to refresh and improve EParent.com in 2002, and look forward to receiving your comments and suggestions. Log on and find out what we are all about!

DIRECTORY OF ADVERTISERS

FREE PRODUCT & SERVICE INFORMATION

A SPECIAL SERVICE FOR EXCEPTIONAL PARENT READERS!

This Reply Card enables you to receive FREE information about products and services seen in Exceptional Parent.

How to use this service:

1. Locate the number at the bottom of each ad or refer to the Directory of Advertisers.
2. Circle the numbers on the Reply Card that correspond to the companies or products about which you would like to receive free literature.
3. Fill in your name and address on the card and mail the postage-paid card. You will receive free literature from each company for which you circled a number.
4. If both Reply Cards have been removed from this issue, just call or write to the companies directly. Be sure to tell them you saw their ad in Exceptional Parent!

Exceptional Parent magazine has accepted product and service advertising since 1973 because advertising provides important information for consumers. The acceptance of advertising in Exceptional Parent does not constitute nor imply endorsement by Exceptional Parent magazine, its editors or its Editorial Advisory Board. Readers need to consult with trusted clinicians to determine the appropriateness of products or services for their specific needs.

EDITORIAL INFORMATION: Contact Exceptional Parent, 65 East Route 4, River Edge, NJ 07661. Return postage must accompany all manuscripts, drawings and photographs submitted. Publisher assumes no responsibility for unsolicited material.

PHOTOCOPYING: Nothing may be reprinted in whole or in part without written permission from the publisher. Authorization to photocopy items for internal or personal use, or the internal or personal use of specific clients, is granted by Psy-Ed Corporation for users registered with the Copyright Clearance Center (CCC) Transactional Reporting Service, provided that the base fee of $2 per copy, plus $.75 per page is paid directly to CCC, 222 Rosewood Drive, Danvers, MA 01923. Customer Service: 508-750-8400. For the organizations that have been granted a photo copy license by CCC, a separate system of payment has been arranged.

The fee code for users of the Transactional Reporting Service is: 0046 9157/89/$2.00 + .75.

MICROFILM: Microfilms of all issues are available from University Microfilms, 300 North Zeeb Road, Ann Arbor, MI 48106

NFADB

National Family Association for Deaf-Blind is a non-profit, volunteer-based family association. Our philosophy is that *individuals who are deaf-blind are valued members of society and are entitled to the same opportunities and choices as other members of the community.*

NFADB is the largest national network of families focusing on issues surrounding deaf-blindness. Using a team of eleven Regional Directors and an Executive Committee, we advocate for all persons who are deaf-blind of any age and cognitive ability. We publish a tri-annual newsletter; support national policies to benefit people who are deaf-blind; collaborate with professionals; work with national projects; and maintain a website with a chatroom and listserv for members.

For more information or to contact your Regional Director:

Affordable, high quality adaptive equipment. Custom furniture and prescriptive equipment available.

Exceptional children deserve exceptional care.

The best help for cerebral palsy, spina bifida and related disorders is at Kennedy Krieger Institute.

For 61 years, Kennedy Krieger Institute has been the leader in helping children with severe disabilities. Focusing on early identification, intervention and treatment, our state-of-the-art interdisciplinary team approach—combined with a caring, supportive touch—has enabled generations of children to live their lives to the fullest.

Our comprehensive assessment and treatment for children with cerebral palsy, spina bifida and related disorders includes: Neurology, Medical Services, Nursing, Urology, Orthopedics, Physical Therapy, Occupational Therapy, Orthotist, Clinical Psychology, Neuro-Psychology, Seating, Feeding, as well as Rhizotomy, Spasticity and Movement Disorder clinics.

And unlike many programs, we see patients beyond age 18. Call Kennedy Krieger Institute today. We're here to help.

You and those you serve are the inspiration behind what we do.

We are a national insurance and risk management firm insuring agencies that provide services to people with disabilities. We understand and actively engage ourselves in the efforts needed to achieve quality outcomes.

We also offer individual policies:

- ***Guardians/Care Managers Liability***
- ***Life Insurance for Individuals with disabilities***
- ***Residential Home Care Providers Liability***

If you need a referral to a provider agency in your area please contact us at 800.622.8272.

Written exclusively through independent agents/brokers

Package policies include:
Professional & General Liability,
Property, Crime, Auto & Umbrella

PATHFINDER VILLAGE

Specializing in Down Syndrome

Pathfinder Village is a warm, friendly community in the rolling hills of Central New York. Here children and adults who have Down syndrome realize success as they work in the community, go to school, and take part in recreation & social programs.

Pathfinder Village offers:

- **10 nurturing family homes**
- **a dedicated & caring staff**
- **year-long school with teen vocational program**
- **on-site nursing staff**
- **outreach services at the Kennedy • Willis Center on Down Syndrome**
- **a history in human services dating to 1922**

As our residents grow in independence, they build lasting friendships, become partners in the world, and take in all that life has to offer.

2002 EP Editorial Calendar

In an age of chronic information overload, EP is dedicated to bringing its readers the crucial information they need. In addition to regular columns and features such as Search and Respond and Familiar Faces, EP will include educational programs such as the continuing series on oral health. And every month, EP includes a special section on a specific topic*:

	Early Childhood—From fetal ultrasounds through the routine checkups of toddlerhood, there are many points for early diagnosis and treatment of special needs.
MARCH	**Life Planning**—Financial and estate planning are only part of ensuring life-long care of your dependent with a disability. **Summer Fun**—Choosing camps and other summer programs. Tips for fun, accessible travel that everyone can enjoy.
	Special Advertising Section: Schools, Camps and Residences
APRIL	**Medical Research Update**—The latest theories and treatments in several areas. Reviewing clinical trials that are seeking participants.
	Special Advertising Section: Mobility
MAY	**Transitioning**—A life-long concern, including education, living arrangements and sociopsychobiological issues.
	Special Advertising Section: Van Conversion Dealers
	Technology—Reporting on new trends, products and possibilities. Augmentative and alternative communication devices, software programs, adaptive equipment and more.
JULY	**Teenagers and Young Adults**—How to cope with significant personality changes, mood swings and the need for independence. How to maintain your love and support for your teenagers when you want to tear your hair out!
AUGUST	**Healthcare**—Current information on treatments, procedures and research. Updates on changes in healthcare legislation. Managed healthcare, health insurance, Medicaid and other funding sources.
SEPTEMBER	**Education**—Parents and educational professionals share experiences and offer suggestions. Achieving optimal services for your student in a time of tight budgets and resistance to change.
	Special Advertising Section: Schools, Camps and Residences
	Toys, Games and Play—Toys for fun, learning and comfort. Adaptive sports and fitness. Play and creativity. Issue for 2002 World Congress & Exposition on Disabilities.
NOVEMBER	**Stress Management**—Covers sources of stress and how to minimize it. Some coverage of complementary and alternative therapies.
DECEMBER	**Family and Community**—Reaching out to others; community involvement; participation in religious and spiritual activities. Direct Support Professional (DSP) forum.

A Better Bedtime Story

The Vail Enclosed Bed

Once upon a time, parents of special-needs children dreamed of a way to make bedtime easier and safer. With Vail Beds, everyone sleeps happily ever after. Your child enjoys the soft, non-threatening security of an enclosed hospital bed—while you enjoy peac of mind knowing they are protected during the night. Vail Enclosed Beds:

- Protect against falls and injuries.
- Reduce wandering.
- Encourage more relaxed sleep—for you child and you.

Vail Beds also accommodate medical equipment; fit all ages from child to adult; feature lifetime service; and come complete with mattress, manually adjustable hospital bed and vinyl border and bedskirt. Plus, we provide assistance in obtaining insurance approval.

Available from home health-care products dealers, or direct from th manufacturer.

CAN YOU FIND THE SYMPTOMS OF CARNITINE DEFICIENCY IN THIS PICTURE?

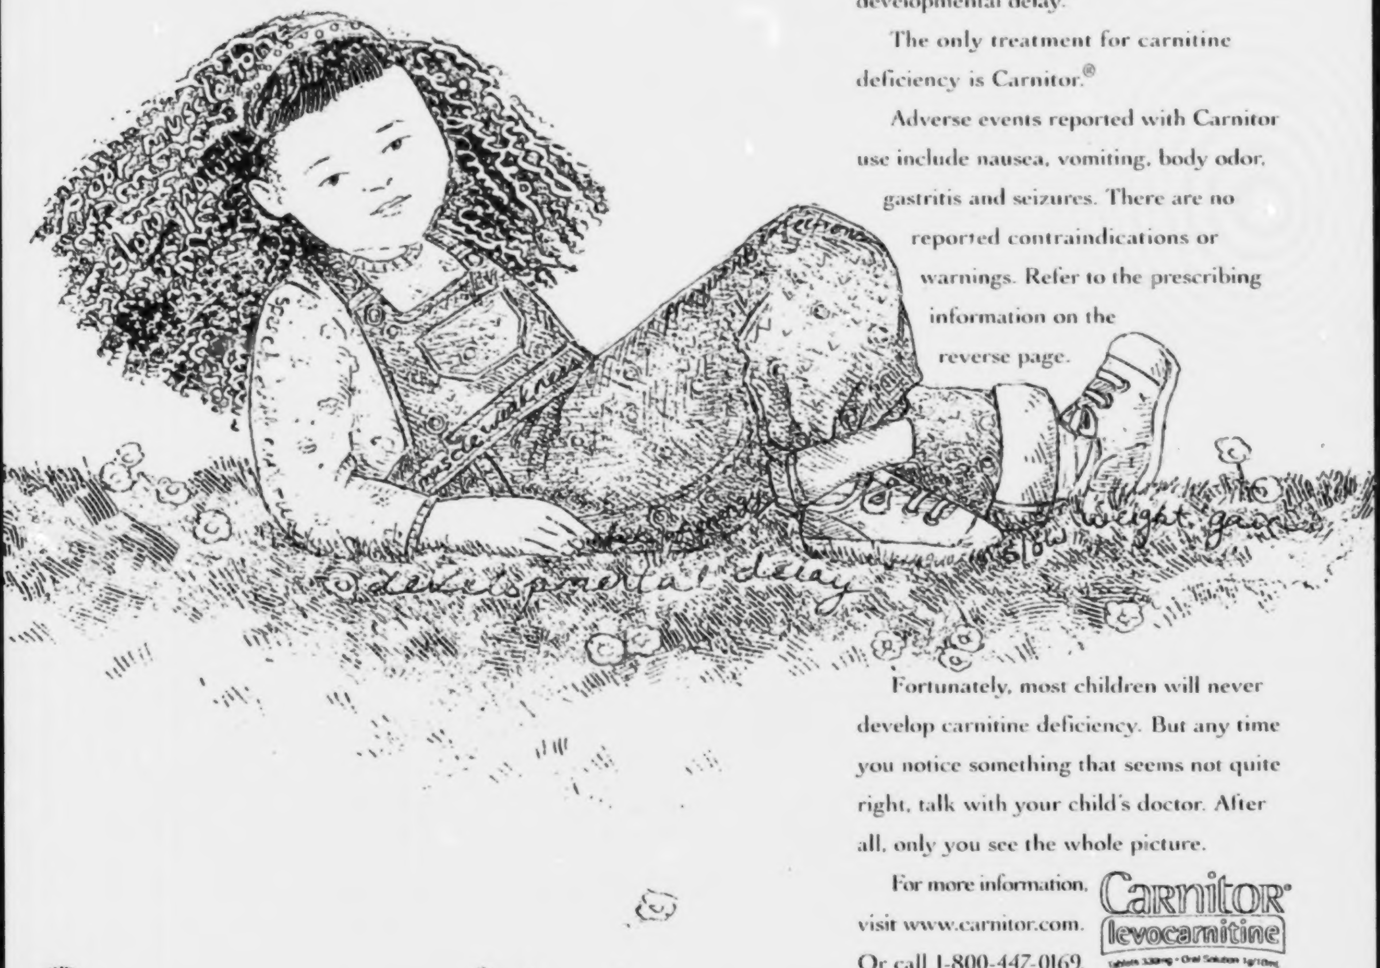
No one knows your child as well as you do. So no one's better at seeing the subtle things that affect your child's health. Things like carnitine deficiency.

Carnitine is a naturally occurring substance that's essential in the metabolic process. If the body is deficient in carnitine, the ability of the cells to produce energy and to remove toxic wastes is impaired. And while carnitine deficiency can be serious, its symptoms are hard to detect and are often overlooked.

Signs include muscle weakness, frequent infection, seizures, poor muscle tone, slow growth, speech difficulties, slow weight gain, lack of energy and developmental delay.

The only treatment for carnitine deficiency is Carnitor.®

Adverse events reported with Carnitor use include nausea, vomiting, body odor, gastritis and seizures. There are no reported contraindications or warnings. Refer to the prescribing information on the reverse page.



Fortunately, most children will never develop carnitine deficiency. But any time you notice something that seems not quite right, talk with your child's doctor. After all, only you see the whole picture.

For more information, visit www.carnitor.com. Or call 1-800-447-0169.

Carnitor®
levocarnitine
Tablets 330mg • Oral Solution 1g/10mL

Circle #48 or visit www.eparent.com/adinfo

Carnitor®
levocarnitine

Tablets 330mg • Oral Solution 1g/10mL

CARNITOR® (levocarnitine) Tablets (330 mg)
CARNITOR® (levocarnitine) Oral Solution (1 g/10 mL multidose)
FOR ORAL USE ONLY. Not for parenteral use. Rx only.

BRIEF SUMMARY

The following is a brief summary. Please see package insert for full prescribing information.

CLINICAL PHARMACOLOGY

CARNITOR® (levocarnitine) is a naturally occurring substance required in mammalian energy metabolism. It has been shown to facilitate long-chain fatty acid entry into cellular mitochondria, therefore delivering substrate for oxidation and subsequent energy production. Fatty acids are utilized as an energy substrate in all tissues except the brain. In skeletal and cardiac muscle they serve as major fuel. Primary systemic carnitine deficiency is characterized by low plasma, RBC, and/or tissue levels. It has not been possible to determine which symptoms are due to carnitine deficiency and which are due to the underlying organic acidemia, as symptoms of both abnormalities may be expected to improve with carnitine. The literature reports that carnitine can promote the excretion of excess organic or fatty acids in patients with defects in fatty acid metabolism and/or specific organic acidopathies that bioaccumulate acyl CoA esters.

Secondary levocarnitine deficiency can be a consequence of inborn errors of metabolism. CARNITOR® may alleviate the metabolic abnormalities of patients with inborn errors that result in accumulation of toxic organic acids. Conditions for which this effect was demonstrated are: glutaric aciduria II, methyl malonic aciduria, propionic acidemia, and medium chain fatty acyl CoA dehydrogenase deficiency. Autointoxication occurs in these patients due to the accumulations of acyl CoA compounds that disrupt intermediary metabolism. The subsequent hydrolysis of the acyl CoA compound to its free acid results in acidosis that can be life threatening. Levocarnitine clears the acyl CoA compound by formation of acyl carnitine which is quickly excreted.

Levocarnitine deficiency is defined biochemically as abnormally low plasma levels of free carnitine, (less than 20 µmol/L at one week post term) and may be associated with low tissue and/or urine levels. Further, this condition may be associated with a ratio of plasma ester/free levocarnitine levels greater than 0.4 or abnormally elevated levels of esterified levocarnitine in the urine. In premature infants and newborns, secondary deficiency is defined as plasma free levocarnitine levels below age related normal levels.

BIOAVAILABILITY/PHARMACOKINETICS

In a relative bioavailability study in 15 healthy adult male volunteers CARNITOR® Tablets were found to be bio-equivalent to CARNITOR® Oral Solution. Following the administration of 1980 mg b.i.d., the maximum plasma concentration level (C_{max}) was 80 nmol/mL and the time to maximum concentration (T_{max}) occurred at 3.3 hours. There were no significant differences for AUC and urinary excretion observed between these two formulations.

In the same bioavailability study of 15 healthy adult males, CARNITOR® (levocarnitine) Injection administered as a slow 3 minute bolus intravenous injection at a dose of 20 mg/kg showed that free levocarnitine plasma profiles are best fit by a two compartment model. Approximately 76% of free levocarnitine is eliminated in the urine. Using plasma levels uncorrected for endogenous levocarnitine, the mean distribution half life was 0.585 hours and the mean apparent terminal elimination half life was 17.4 hours following a single intravenous dose.

The absolute bioavailability of L-carnitine from CARNITOR® Tablets and Oral Solution was determined compared to the bioavailability of L-carnitine from CARNITOR® Injection Intravenous in 15 healthy male volunteers. After correction for circulating endogenous levels of L-carnitine in the plasma, absolute bioavailability was 15.1% ± 5.3% for L-carnitine from CARNITOR® Tablets and 15.9% ± 4.9% from the Oral Solution.

Total body clearance of L-carnitine (Dose/AUC including endogenous baseline levels) was a mean of 4.00 L/hr. Endogenous baseline levels were not subtracted since total body clearance of L-carnitine does not distinguish between exogenous sources of L-carnitine and endogenously synthesized L-carnitine. Volume of distribution of the intravenously administered dose above baseline endogenous levels was calculated to be a mean of 29.0 L ± 7.1 L (approximately 0.39 L/kg) which is an underestimate of the true volume of distribution since plasma L-carnitine is known to equilibrate slowly with, for instance, muscle L-carnitine.

L-carnitine was not bound to plasma protein or albumin when tested at any concentration or with any species including the human.

INDICATIONS AND USAGE

CARNITOR® (levocarnitine) is indicated in the treatment of primary systemic carnitine deficiency. In the reported cases, the clinical presentation consisted of recurrent episodes of Reye-like encephalopathy, hypoketotic hypoglycemia, and/or cardiomyopathy. Associated symptoms included hypotonia, muscle weakness and failure to thrive. A diagnosis of primary carnitine deficiency requires that serum, red cell and/or tissue carnitine levels be low and that the patient does not have a primary defect in fatty acid or organic acid oxidation (see Clinical Pharmacology). In some patients, particularly those presenting with cardiomyopathy, carnitine supplementation rapidly alleviated signs and symptoms. Treatment should include, in addition to carnitine, supportive and other therapy as indicated by the condition of the patient.

CARNITOR® (levocarnitine) is also indicated for acute and chronic treatment of patients with an inborn error of metabolism that results in a secondary carnitine deficiency.

CONTRAINDICATIONS

None known.

WARNINGS

None.

PRECAUTIONS

General

CARNITOR® (levocarnitine) Oral Solution is for oral/internal use only.

Not for parenteral use.

Gastrointestinal reactions may result from too rapid consumption of carnitine. CARNITOR® (levocarnitine) Oral Solution may be consumed alone, or dissolved in drinks or other liquid foods to reduce taste fatigue. It should be consumed slowly and doses should be spaced evenly throughout the day to maximize tolerance.

Carcinogenesis, mutagenesis, impairment of fertility

Mutagenicity tests performed in *Salmonella typhimurium*, *Saccharomyces cerevisiae*, and *Schizosaccharomyces pombe* indicate that CARNITOR® (levocarnitine) is not mutagenic. Long-term animal studies have not been conducted to evaluate the carcinogenicity of the compound.

PREGNANCY

Pregnancy Category B.

Reproductive studies have been performed in rats and rabbits at doses up to 3.8 times the human dose on the basis of surface area and have revealed no evidence of impaired fertility or harm to the fetus due to CARNITOR®. There are, however, no adequate and well controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

NURSING MOTHERS

It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

PEDIATRIC USE

See Dosage and Administration.

ADVERSE REACTIONS

Various mild gastrointestinal complaints have been reported during the long-term administration of oral L- or D,L-carnitine; these include transient nausea and vomiting, abdominal cramps, and diarrhea. Mild myasthenia has been described only in uremic patients receiving D,L-carnitine. Gastrointestinal adverse reactions with CARNITOR® (levocarnitine) Oral Solution dissolved in liquids might be avoided by a slow consumption of the solution or by a greater dilution. Decreasing the dosage often diminishes or eliminates drug-related patient body odor or gastrointestinal symptoms when present. Tolerance should be monitored very closely during the first week of administration, and after any dosage increases.

Seizures have been reported to occur in patients with or without pre-existing seizure activity receiving either oral or intravenous levocarnitine. In patients with pre-existing seizure activity, an increase in seizure frequency and/or severity has been reported.

OVERDOSAGE

There have been no reports of toxicity from carnitine overdosage. The oral LD_{50} of levocarnitine in mice is 19.2 g/kg. Carnitine may cause diarrhea. Overdosage should be treated with supportive care.

DOSAGE AND ADMINISTRATION

CARNITOR® (levocarnitine) Tablets.

Adults: The recommended oral dosage for adults is 990 mg two or three times a day using the 330 mg tablets, depending on clinical response.

Infants and children: The recommended oral dosage for infants and children is between 50 and 100 mg/kg/day in divided doses, with a maximum of 3 g/day. Dosage should begin at 50 mg/kg/day. The exact dosage will depend on clinical response.

Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution.
For oral use only. **Not for parenteral use.**

Adults: The recommended dosage of levocarnitine is 1 to 3 g/day for a 50 kg subject, which is equivalent to 10 to 30 mL/day of CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 1 g/day, (10 mL/day), and be increased slowly while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

Infants and children: The recommended dosage of levocarnitine is 50 to 100 mg/kg/day which is equivalent to 0.5 mL/kg/day CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 50 mg/kg/day, and be increased slowly to a maximum of 3 g/day (30 mL/day) while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution may be consumed alone or dissolved in drink or other liquid food. Doses should be spaced evenly throughout the day (every three or four hours) preferably during or following meals and should be consumed slowly in order to maximize tolerance.

OBS-2
2/00

Independence means different things to different people. For children with bladder or bowel control problems, it could just mean getting through the day dry. That's why something as simple as a change in clothing, can, even in a small way, change a child's way of life.

WHY CHILDREN WHO RELY ON GOODNITES ARE MORE INDEPENDENT.

GoodNites® absorbent underpants can help a child become more independent. With GoodNites, accidents won't become catastrophes. So your child will be able to do more. Plus, because they look like real underwear, kids don't mind wearing them. And since they're easy to pull on and off, they can make a child feel more self-reliant.

GoodNites are available in 3 sizes: 45–65 lbs., 65–85 lbs., and 85–125 lbs. That means finding the size that fits your child will no longer be a problem. Plus they have tear-away sides and they're latex-free.

- *Day and nighttime protection*
- *Latex-free*
- *Tear-away sides for easy removal*
- *Three sizes, to fit kids from 45–125 lbs.*

Pull-Ups
GoodNites
DISPOSABLE ABSORBENT UNDERPANTS
45 lb & over

For Better Days.

Imagine your child gaining a little more independence just by a change in clothing. For information on how GoodNites can help, and a free sample offer, please visit us at www.goodnites.com/offer

FEBRUARY 2002 • VOLUME 32, ISSUE 2

early childhood

38 **Safety of Your Child with a Disability**
by Cema Mastroleo, MEd, and Wendie H. Abramson, LMSW
Tips on how to teach your child about personal safety.

40 **Early Warning**
"Just a late talker" was a phrase two mothers kept hearing when they questioned their children's lack of verbal ability. Pressing for answers, they discovered the mysterious disorder called verbal apraxia and found out about the importance of early intervention and support.

Dealing with a Parent's Worst Nightmare
by Jeanne Buesser

Evan's Story
by Stacey Abenstein

52 **Effective Social Skills Programming**
by the May Institute, Inc.
Social interactions can often be difficult for children with behavior disorders. With the right information, parents can be proactive in constructing the right social skills program to teach children how to interact appropriately in all the settings of their daily lives.

76 **ORGANIZATIONAL SPOTLIGHT**
Children's Neurobiological Solutions Foundation
by Terry Boisot
Imagine a foundation that supports the collaboration and research of some of the best neuroscientists–to focus not on a disease, but the brain itself.

76 **MEDICAL RESEARCH UPDATE**
Autism and the MMR Vaccine
Some parents believe that there is a link between the MMR vaccine and the incidence of autism. This article reports on the latest research.

Early childhood—a journey of discovery. Copyright ©2002 Laura Dwight

FEATURES

44 **RESEARCH REFLECTIONS**
"Confessions of a Researcher: Blind Alleys, Unintended Consequences and Really BIG Mistakes"
by Jan Blacher, PhD
EP introduces a brand new column contributed by Dr. Jan Blacher, a researcher on family and disability. Starting with this month's installment, Dr. Blacher takes a hard look at the data in the field and what it means for families in their day-to-day lives.

SPECIAL REPORT:

26 **Oral Healthcare for People With Special Needs Part VIII**
The Relationship between Genetic Disorders and Oral Health, Part II: Developmental Anomalies of the Oral Cavity

46 **Coping with Disaster**
by Project Cope
How does your family cope with disaster? Tell us by participating in the Project Cope–EP Family Survey.

54 **Gynecological and Reproductive Services for Teenage and Adult Women with Special Needs**
by Catharine A. Kopac, PhD, GNP
A look at women's healthcare and how people with disabilities are served.

54 **Search & Respond Index 2001**
Topics and dates of reader questions and corresponding replies as they appeared in EP's popular Search & Respond column throughout 2001.

COVER: Cindy and Jeff Grabow are pictured holding their son, Jordan, 2. Jordan loves reading books, bouncing balls and playing with toy cars and trucks. He has a developmental delay of unknown origin.

EDITORIAL MISSION

- To reach out to mothers and fathers of children and young adults who have disabilities and special health-care needs.
- To empower parents and professionals by providing practical information and emotional support.
- To appreciate that parents are the most important experts in the lives of their children.
- To energize parents and professionals.
- To share ideas and experiences so parents, professionals, people who have disabilities, and other advocates can learn from one another and better collaborate to serve all children and families.

Exceptional Parent neither endorses nor guarantees any of the products or services advertised in the magazine. We strongly recommend that readers thoroughly investigate the companies and products being considered for purchase, and, where appropriate, we encourage them to consult a physician or other credentialed health professional before use and purchase.

NOTE FROM THE EDITOR-IN-CHIEF:
While hyperbaric oxygen is effective therapy in certain conditions it is currently considered an alternative therapy for CP and other "brain insult" conditions. Readers are advised to discuss the advisability of HBOT with their primary or specialty healthcare providers as well as to study the current literature.

no more frustration - just fun

LECKEY®

Advance Bath Chair

New Design

The most extensive height range and adjustable seat angles make bath positioning easy.

Extra-soft mesh material and padded support bars give your child a more comfortable and enjoyable bath time.

Take the Advance Bath Chair from the tub to the shower with the optional trolley

Also available is the Basic Bath Support that provides adjustable positioning angles at a fixed height.

And The FUN Doesn't Stop There

Leckey's full line of products have been re-designed to make your child's standing, sitting or toileting experience easier and more enjoyable. Call us today for more information.

- *Lighter mobile bases*
- *More adjustable components*
- *Peer level positioning*
- *Child friendly positioning straps*
- *Playful colors*

THE CENTER FOR CHILDREN • HOSPITAL FOR JOINT DISEASES

Caring for children with
Cerebral Palsy
requires the help of many specialists.

Now you can find them all at
one special place.

The Center for Children is the one place you'll find all the care options you need, with just one concern in mind: your child. By bringing together the resources of the Hospital for Joint Diseases (HJD) and the Rusk Institute of Rehabilitation Medicine (RIRM) of NYU Hospitals Center, we can care for a variety of conditions in one convenient setting. For example, you'll find the widest possible range of treatments for children with cerebral palsy, with in-house specialties including pediatric physiatry, orthopaedics, speech therapy, neurology, neurosurgery, physical and occupational therapy. All in a gentle, kid-friendly environment where there are no white coats, but plenty of color, interaction, toys, games and stimulation. From newborns to 21-year-olds, The Center for Children treats them better. **Call us at 212-598-2330.**

Sally, 40 lbs. and 45" tall, in the #8600 Reclining Bath Chair with #8875 Head Pad

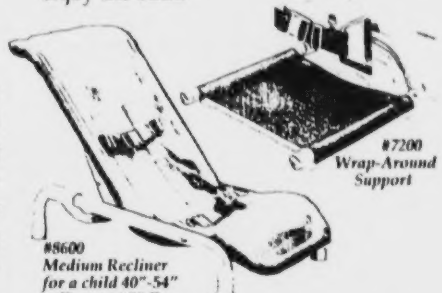
Columbia offers you solutions to the daily challenges of bathing, toileting and transporting your child – *with comfort, safety and ease!*

You and your child face some tough challenges, but you're the one who must solve them in the most practical ways. Here's how we can help:

☐ At toileting time, our **Toilet Supports** fit easily onto any toilet; remove easily, too. And our **Positioning Commodes** give the same toileting support in any location.

#5800 Hi-Back Positioning Commode for junior adults

☐ At bathtime, our popular **Wrap-Around Bath Supports** and **Reclining Chairs** allow your child - and you - to enjoy the bath.



#7200 Wrap-Around Support

#8600 Medium Recliner for a child 40"-54" tall, up to 130 lbs.

☐ When your child has outgrown that infant car seat, you can have peace of mind knowing that the **Columbia Car Seat** has been crash tested for children from 20 to 102 lbs.-yet weighs only 11 pounds! Comfort, style and adjustability have made it the No. 1 choice since 1986.

#2000 Car Seat

Why do these products work so well?
Much thought and care go into the design of each Columbia product. We make each item in the **right size for your child**, with lots of adjustability for a custom fit. They are made of durable materials, proven in real life. Made in the USA and sold all over the world, Columbia products are leaders in *all* their categories.

Get all the details from our FREE full color catalog. "Sharing the Caring" means *products that work!*

editor's desk

On Noticing A Noticeable Difference

ILLUSTRATION BY MS MEMORY COLLINS

It's not an unusual scenario. Concerned parents bring their infant to the pediatrician to report something they are observing or not observing. The physician calms the parents by saying "it's not so unusual," or "let's look at it in another six months." Most of the time the developmental milestone is reached, albeit on a timetable that isn't always by the book. Sometimes the parents will do their own rationalizing and turf the decision to mention it to the doctor, or not even see the doctor for another six months.

When growth deficits, developmental delays, sensory deficits or serious behavioral problems manifest themselves, they occur on a continuum. A child doesn't suddenly get diagnosed with failure to thrive or fine motor impairment or autism. When is something that's noticed noteworthy?

By age 2 years, the typical child runs well.

When do we see the red flags? When do we call for an assessment, when do we initiate treatment, when do we bring in the labels? When does "runs" become "runs well?"

The answer, of course, is based on perception, judgment, experience, school of thought and—certainly—comfort level. The latter reflects that of the clinician, the parent, the payors and the community. "Aggressive" pediatricians will perceive (and act on) things differently from conservative pediatricians. The actions of either will, of course, be modulated by the insistence of the parents, their practice environment and their instincts.

The preschool child normally grows about 3 to 5 pounds and 2.5 to 3 inches per year.

How does a thermos bottle know whether it's full of hot or cold liquid? How does a clinician know when to mobilize the troops of inquiry?

Most of the pediatricians I know will usually be at a loss to answer that question. You'll hear things like: "You just know;" "You'll know when you know;" "It somehow announces itself"; or "It will hit you." Not exactly pearls of wisdom the medical student can transfer from case to case, nor a response that would be applauded by an attending physician on rounds. So how does a clinician know and, more important, how does a parent know when to be alerted to these things? When does a mental note become an office visit?

By 7 to 9 months an infant will use partial thumb opposition to grasp pellets (and where do parents get these pellets, anyhow?).

How do we take what we observe as parents and professionals and assign them to the front or back burner of concern? When does "Oh" become "Oh!" or "Oh my!" or the defining "Oh my God!"? How do parents monitor coordination, when grasping and reaching (gradually) come under visual guidance and voluntary control? How do our perceptions of these things kick into gear? What's the impact of our fears, dreams, nightmares –and how do they temper, delay, or magnify our recognition of our kids' "red herrings"?

There's a science to these things, complete with laws, fractions, ratios and derived statistical measurements. Daily, parents and clinicians (and teachers, therapists and grandparents) unknowingly apply Weber's Ratio, Fechner's Law and Steven's Magnitude Estimation and decide whether what they see is worth one, two or three eyebrow raises. The "difference threshold" (or difference limen) is the smallest difference between two stimuli necessary to detect them as different. The difference threshold tries to answer questions: "is that response autistic or just indifference, that dropped coin clumsiness or pincer impairment?"

Only science could come up with the JND unit, the Just Noticeable Difference. How far do we have to increase the intensity of a tone before we can tell there's a difference? The magnitude of this difference in intensity specifies the difference threshold. How can parents become comfortable with "let's wait and see?" How do parents and professionals use the JNDs to form impressions, initiate action and redefine the notion of allowable and acceptable?

When does something become some THING?
When does a drizzle become rain?
When do words become prose?
When does an oral feeder become tube-fed?
When does consistent become constant?
And when does sensation become perception?
And when does "watchful wait" become "doing nothing"?

Beyond the framework of psychophysics, which examines the relationships between physical stimulation and subjective experience, lies your gut; and whether the gut is the gut of a surgeon, a soldier, a salesman or an exceptional parent, it's something you can often rely on. Sometimes it's the only bullet on the belt. Often you know it before the anthrometrics hit the boundaries of the borders. Call it a gut feeling, intuition, a voice from within or hoofbeats, it's there. And it's something that both parents and clinicians need to recognize, respect, consider and explore.

Early intervention begins with early assessment and early determination; and these assuredly begin with an early feeling, usually perceived somewhere in the center of a lawless land we call the gut. EP

LESSONS TAUGHT BY THE CLASS OF 2001

To the Editor:
My name is Troy Daniels and I am a junior at Northfield High School. I have Down Syndrome. Because I have a weak heart, I sometimes use a wheelchair. I do not speak very well.

I want to tell you that inclusion is not a place, but a feeling. It wasn't too long ago that a person with a disability could not go to public school to receive an education. Labeled "retards," they were shut away in institutions without any link to the outside world.

Now that times have changed, there is a law that says all kids like me can go to school in their hometown. So I started school in my hometown of Northfield, Vermont as a member of the class of 2001. But even though I was allowed to go to school here, the law could not make people believe that I belonged there. The law did not change the prejudice that many people still felt towards me.

But along the way the kids in my class started to care about me. First, it was only one or two. Then others found out that they could be my friend. We were learning together. They wanted me to be here and they were willing to share with me. They called me a friend and made sure that I was included. I care about them and they care about me.

So I wanted you to see that my friends are not only students; they are the teachers of life. They show us how we should be. We are better inside when we can share with each other.

Thanks,
Troy Daniels

DISAPPOINTED IN THE GOV

To the Editor:
I found it very interesting that Gov. Bush was on the cover of the December 2001 issue of EP. He has just decided to include the Choice and Control Pilot Project for consumers of the Developmental Disabilities Program in the budget cut list. He chose not to line item veto it (to save it) and maintain it for the remaining six months of the Pilot Project. What that means is that consumers like my son have lost the opportunity to have self-determination and control over the funds that he is eligible for. He, like the other consumers in this Pilot Project, will go back on the Medicaid Waiver. For now the opportunity to have consumer-directed services is lost. Although there are those in the state of Florida who continue to work toward this goal, the leadership has only offered empty rhetoric. I thought your readers would be interested in another side to the story.

Thanks,
Susan Redmon

EDITOR'S NOTE: In mid October, when Governor Bush was interviewed, he indicated that budget cuts were necessary, but did not specify which programs were subject.

IMPRESSED WITH EXCEPTIONAL PARENT

EXCEPTIONAL PARENT
Health

Dear Dr. Rader:
I'm writing in regards to your magazine. I find the articles interesting, especially the article on Heather Whitestone (August 1995). I've also read the parents' stories of their trials and tribulations in rearing and nurturing their child/adult with disabilities. They also have to face the obstacles in finding the funds to help provide the accomodations needed to take care of their child/adult with disabilities. They also work tirelessly and endlessly to cope, in trying to find the best environment and the insurance that will help them to provide for their loved one. I also want to encourage the parents not to give up hope and to continue to strive as advocates for their rights and the rights of their child/adult with disabilities to be able to contribute to society.

I also find that the articles featuring persons who have hearing-impairments/ deafness really makes a difference for me, because I have a moderate to severe hearing loss in both ears. I also use sign language as a second method of communication. Learning to cope with it hasn't always been easy. I've chosen to make the sacrifices needed daily to help me overcome this disability. I also appreciate the different books and resource guides that are available to order at the end of this magazine. The teaching and sharing of stories about this issue are also helpful. Thank you, Mr. Rader for this opportunity to write to Exceptional Parent Magazine, to share my views. Best of wishes to you and the staff that have made this magazine possible.

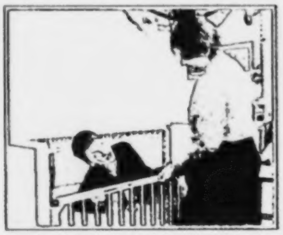
HARD MANUFACTURING

AGE APPROPRIATE

BEDS

For when your child passes the crib stage!

Dianna Fitzgerald
& Her Son Nicholas



The Stockton features full crib safety sides

Beds for children once they pass the crib stage are always an issue with parents. . . I can't begin to tell you how terrific the people at HARD Mfg. are. Mary Bias, the rep for the Indiana area told me she knew exactly what I wanted and needed for Nicholas. Thirty-days later the Stockton Bed arrived and it couldn't be more perfect! The Stockton comes in three sizes, with crib type rails, and a height adjustment up to 34"... saving my back! It even has a mounted IV pole for Nicholas' feeding pump. Mary had also suggested the white bed with a red outer footboard and yellow inner headboard...

It truly is the best investment we ever made.

Thank You HARD!
Dianna Fitzgerald

- HARD "Age Appropriate" Beds accommodate your child with the safety and convenience you would expect from the nation's #1 manufacturer of hospital cribs and youth beds.
- Available in a rainbow of colorful epoxy finishes and laminate colors to match your room decor.
- Hi-Lo adjustment for convenience and safety.
- Attains all orthopedic and comfort positions.
- Currently available in custom sizes to accommodate all ages.
- Crib type safety sides are close to the mattress to protect arms & legs.

For information about our full line of beds and cribs,
as well as locating your nearest HARD dealer, please give me a call.

About Search & Respond

Search and Respond is an opportunity for our readers to exchange information about their practical experiences in meeting the everyday challenges of life with a child or adolescent who has a disability. In this column, "S" represents Search letters and "R" represents Respond letters received to a previously printed Search. "Instant S&R" is a new feature which represents e-correspondence we have downloaded from our Web site. All Responds are forwarded to the writers of the original Searches; some are published. Published letters may be edited for purposes of space and clarity. We also expect parents to consult appropriate professionals.

When sending correspondence, please indicate whether it is a Search or a Respond. For Responds, be sure to note in which issue the original Search letter appeared. Please remember to include a phone number on all correspondence, in the event that more information is required. Write to: Exceptional Parent, Attn.: Search/Respond, 65 East Route 4, River Edge, NJ 07661; Fax to: (201) 489-0074; e-mail to epedit@aol.com; or visit Search & Respond on our Web site: http://www.eparent.com.

For information about specific disabilities, contact: the National Organization for Rare Disorders (NORD), 100 Rt. 37, PO Box 8923, New Fairfield, CT 06812; (800) 999-6673; (203) 746-6518; Web site: http://www.rarediseases.org. Also, see the "National Resources for Specific Disabilities" directory in Exceptional Parent's 2002 Resource Guide (January 2002, starting on page 22).

Each month, Chris Feudtner, MD, PhD, reviews Search & Respond for accuracy and completeness. Dr. Feudtner is a pediatrician at the Pediatric Care Center of the University of Washington in Seattle. Look for Dr. Feudtner's comments on certain Search & Respond letters.

S

Krause-Kivlin syndrome

My 6-year-old daughter was diagnosed with Krause-Kivlin syndrome when she was 6 months old. Her symptoms include seizures, kidney disorder (double collecting system with frequent urinary tract infections), small ventral septal defects (VSDs) of the heart, failure to thrive, glaucoma, short optic nerves, cloudy corneas and Peter's anomaly of the eye. There are very few cases in the world with this syndrome. Any information would be helpful.

-GS via the EP Web site

S

GT difficulty

I am raising my seven-year-old grandchild who has a profound brain injury and who had a fundoplication for gastroesophogeal reflux disease (GERD). As a result of the surgery, he experiences abdominal pain and distension that requires manual venting of his gastrostomy tube (GT) throughout the day. The tube bleeds at the site of insertion and internally with minimal manipulation. He is no longer able to lie on his abdomen and this impedes his progress in PT, OT, vision therapy, etc. The discs catch on his clothes, high chair and other people's clothes. It dangles between his legs, becomes caught and is pulled out when he attempts to sit up. Cognitively, he is unable to prevent this problem. Tape is not a possibility. I have tried a binder foam disc on top of the disc of the GT. Because of his need for continuous venting, he is not a candidate for a button GT. Any suggestions?

-SH via the EP Web site

S

School bus cannot enter gated community

Our son has cerebral palsy and attends public school. He has an Individualized Education Program (IEP) and doctor's documentation requiring an exceptional education school bus with climate control. We recently moved to a neighborhood with an electronic gate and the school system will not allow the bus to come into the neighborhood unless the access panel is modified. We have offered the bus driver a remote control (like a garage door opener) but the supervisor will not allow it. Does anyone have any experience with a similar circumstance? Would this situation be covered as a reasonable modification by the Americans with Disabilities Act (ADA)?

-KM via the EP Web site

R

Bathtub advice

VL (Oct 2001) has a 4-year-old son who has severe multiple disabilities due to complications from cystic fibrosis. VL's child has grown too large for an infant bathtub, and his equipment is too large for the bathroom. VL wants to hear from any parents who have dealt with a similar situation and who may have creative solutions.

As foster parents we have cared for a number of children that were difficult to bathe in a regular bath tub. Our solution was to use a deep laundry tub. They measure about 22 in. long x 17 in. wide x 13 in. deep and are made of reinforced fiber glass. They can be purchased at home improvement centers and/or plumbing supply stores.

-HM via the the EP Web site

I have dealt with a similar issue; I used a small inflatable children's wading pool in my living room. I propped my child's head up on an inflatable toy bat. Scooping water with dish pans, I was able to shampoo and bathe him this way. We would then transfer him to the side on a beach towel. This worked great.

-NL via the EP Web site

R

Feeling Isolated

TK has a 4-year-old daughter with Angelman syndrome (AS). Her symptoms include microcephaly, uncontrollable laughter, seizures, absent speech, feeding difficulties and sleep problems. TK believes that the child is not receiving proper medical care and feels lost, alone and isolated.

I have a 27-year-old daughter with AS. She was not diagnosed until she was 25. Your little girl will grow up to be a wonderful person. When she becomes an adult, she will mellow and calm down. Our Patricia is a delight now, but it was very difficult until she was about 20 years old.

-CS via the EP Web site

We have a 4-year-old son who has AS with similar symptoms. You might want to visit the Angelman Syndrome Foundation's Web site,

AN EXTRAORDINARY PROMISE — AN ORDINARY LIFE

If you or someone you love has had their life turned upside down by epilepsy, an everyday, ordinary life can be the most extraordinary promise of all.

So if you're dissatisfied with the quality of life and seizure control you've had from anti-seizure medications, or you've found their side effects intolerable, discover the difference that VNS Therapy™ can make.

VNS Therapy has been used by over 15,000 patients like Brady with refractory epilepsy that hasn't responded to multiple medication regimens.

If at least two anti-seizure medications haven't worked, ask your doctor about adding VNS Therapy. It's not brain surgery. It's a medical device the doctor implants in the chest, with leads that run up to the vagus nerve in the neck.

It provides significant seizure control for many patients, with no debilitating side effects, and improvement in alertness, fatigue and mood. Some patients are even helped as dramatically as Brady, although VNS results may vary.

BEST COPY AVAILABLE

VNS Therapy is indicated for use as an adjunctive therapy in reducing the frequency of seizures in adults and adolescents over 12 years of age with partial onset seizures that are refractory to antiepileptic medications. See your Neurologist or Surgeon for all reported and potential side effects, warnings, precautions, and contraindications related to VNS.

Do something extraordinary today. Ask your doctor if VNS Therapy is right for you. Call us at **1-866-281-4686**. And visit our Web site at www.cyberonics.com. Your whole life is waiting.

continued from page 19

which has many links for medical professionals as well as information for families. For instance, most states have a Local Parent Contact for families who are coping with this disease. There is also an annual picnic. Meeting other Angelman families helps to build new friendships, establish support and benefit our angel kids. We have met many families in the past 3 years at picnics and other gatherings. To contact the foundation, call: (800) IF-ANGEL or visit their Web site at: http://www.angelman.org

–DT via the EP Web site

In addition to the Angelman Syndrome Foundation Web site, which includes a directory that lists parents of children who have AS, there are many other support groups for parents of children who have special needs. Our public school preschool program is a wonderful resource, and our speech therapist has worked with several AS children before. She currently has 2 AS, non-verbal girls in her care now, and I love hearing about their progress. Periodic crying jags and depression are definitely normal. Our daughter has a severe sleeping disorder, which is also typical of an AS diagnosis.

–BK via the EP Web site

Looking for Brushes

SR (Nov 2001) is looking for brushes with poly bristles, the kind used by surgeons for scrubbing up.

If you only need a few of these handy scrub brushes, you can buy them in the produce section next to the corn; they are used for brushing off the corn silk.

–BA via mail

Orthodonture for child with Down syndrome

Karla (Nov 2001) has an 11-year-old daughter with Down syndrome. The family dentist recommends that she have braces. Has anyone gone through this process? Is the outcome worth it emotionally and financially?

My 18-year-old daughter has cerebral palsy and cognitive impairment. Because she has had a lot of surgeries, she is absolutely terrified of any medical treatment. Three years ago, we decided to try to straighten her teeth, and we weren't optimistic. We were turned down flat by three orthodontists who weren't willing to work with her screaming, resisting, etc. We were then referred to a wonderful, patient orthodontist who had done a lot of work with children who have Down syndrome. This doctor always scheduled Sarah last so her noise wouldn't disturb other patients. She spent a lot of time talking to Sarah, showing her equipment and introducing her to the office staff, who treated her like a queen. I stayed out of sight, which also helped her work harder to control her fears. Amazingly, Sarah was fitted with braces and went through 2 years of treatment. Her teeth look wonderful, her drooling has decreased somewhat and her speech is easier to understand. Was it worth it? Absolutely!

–CM via the EP Web site

I work with a young lady who has Down syndrome who is 25 years old. Five years ago, she had braces placed both on her upper and lower teeth. Now that it's time to take them off, they found her teeth have shifted beautifully into place but have not "tightened" in again. Ultimately, if they remove the braces, her teeth will fall out. The orthodontist said this happened because her roots are short. Why they didn't know this before I don't know. I would at least ask about this before proceeding. Good luck!

–AH via the EP Web site

Hyperacute Hearing

DB (Nov 2001) has a 14-year-old daughter who has cerebral palsy, developmental delay and speech impairment. When she had her tonsils removed at age 11, she developed hyperacute hearing. The problem has progressed significantly, so that she shakes and trembles in anticipation of any noise. DB is looking for advice and information about hyperacute hearing.

My daughter is 8 years old and has hyperacute hearing along with several other disabilities. I have looked into a treatment called Auditory Integration Therapy (AIT). It is a way to retrain the ear to hear correctly. There is an organization that can explain how AIT works. It is called the Georgiana Institute, and it is based in Connecticut. The director/founder is Annable Stehli; her daughter Georgie suffered from hyperacute hearing and had been diagnosed with autism. She was cured of the problem by a doctor in France who founded AIT. I have spoken with Annable, and she is very helpful. For more information, visit their Web site: http://georgianainstitute.org

–BB via the EP Web site

My daughter is 11 years old and she had AIT therapy at the age of 10. Though it is not offered everywhere, you can search the Internet for locations near you. We went to Allentown, PA. The therapy lasts 30 minutes twice a day for a two-week period. It is non-invasive and all it requires the child to do is to listen through headphones to different music and sounds. My daughter has improved significantly; she can now go to restaurants, malls, doctor's offices, even bowling! Good luck.

–AC via the EP Web site

Instant S&R

Keeping the bed dry

My 11-year-old daughter is incontinent. She has multiple disabilities and mental retardation. During the day she is able to hold her urine if we take her to the bathroom regularly. At night, however, she frequently wets herself. I have her in pull-up diapers. I've bought plastic pants. I don't give her fluids after 7 p.m. Yet she keeps urinating through her diaper and plastic pants and I have to change the bedclothes daily. I need advice on how to keep the bed dry. We live alone, I work full time, and it is exhausting and expensive to do laundry daily. Any suggestions?

–SO via the EP Web site

Try an overnight diaper. I use Tranquility's All-Through-the-Night diaper with an extra booster pad inside. This prevents leaks for 12-14 hours. A supplier such as HDIS provides several brands and accepts many types of insurance.

–SM via the EP Web site

Try asking your doctor about DDAVP, a nasal spray which helps to reduce the amount of urine that the body produces. It worked for our family when we were dealing with bedwetting.

–CF via the EP Web site

All children should be seen. And heard.

With free Verizon assistive equipment, the lines of communication are open to children with disabilities.

If you're the parent of a child with a disability, you know that talking on the phone is just as important to him as it is to every other child. Which is why, if your child qualifies, you should apply for free assistive equipment from Verizon. To qualify, your child must be under 18 and have a certified disability that hinders him (or her) from using the phone, and receive SSI disability benefits.

The equipment covers the range from TTYs and volume-amplified telephones to light signalers, loud tone ringers, and large-number and hands-free telephones.

As you already know, every child has something to say. Now yours can say it on the phone much easier than before. **For recorded information about the program or to request an application, call 1 800 882-6828 (V) 1 800 299-2640 (TTY)**

This is a limited time offer and applies only to New York State Verizon customers or their dependents living in the same household, for as long as our supply of this equipment lasts.

Autism Fact Sheets Now Available From NICHD

The National Institute of Child Health and Human Development (NICHD) supports ongoing research to better understand autism, its causes and potential treatments. Now NICHD is making available a series of six fact sheets describing the latest research findings: Autism Facts; Autism Questions and Answers for Healthcare Professionals; Autism and Genes; Autism and the MMR Vaccine; Rett Syndrome; and The NICHD/NIDCD Network on the Neurobiology and Genetics of Autism: The Collaborative Programs of Excellence in Autism (CPEAs). These fact sheets are available for free. To contact the NICHD, call: (800) 370-2943 or visit the NICHD autism web site: http://www.nichd.nih.gob/autism/

Bears for the Kids

The Cleft Palate Foundation is the temporary home for hundreds of "cleft teddy bears" waiting to touch the lives of children and families affected by cleft lip and palate. The bears are custom-made by Gund, Inc. as part of the Foundation's "Bears for the Kids" project, which aims to help children cope with the questions and anxiety they experience from having facial differences. For more information about the project or to order a bear for your family, contact the Cleft Palate Foundation at: (800) 24-CLEFT, or visit their Web site: http://www.cleftline.org

New AAP Program Focuses on Universal Newborn Hearing Screening

The American Academy of Pediatrics (AAP) was recently awarded funds, in the form of a cooperative agreement with the Maternal and Child Health Bureau and the Centers for Disease Control and Prevention, for a program entitled, "Improving the Effectiveness of Newborn Hearing Screening: Diagnosis and Intervention through the Medical Home."

In a joint effort with the National Center for Hearing Assessment and Management (NCHAM), Utah State University and the Joint Committee on Infant Hearing, the AAP plans to disseminate educational materials, advocate state and local policy improvement, improve AAP state chapter Early Hearing Detection and Intervention (EHDI) programs and help identify problems in quality of programs.

SDSC Toll Free Number

The toll-free number of the Self Directed Support Corporation (SDSC) is now up and ready. SDSC is a group of not-for-profit corporations that are developed to provide a legal entity to manage the support system for a person with a disability. SDSC services help individuals to identify supports needed in life and to establish individual budgets, support brokerage and fiscal intermediaries. The goal of SDSC is the establishment of a person-centered corporation to meet the unique support needs of a person with a disability. The Inclusion Research Institute has established a toll free number to assist with questions regarding SDSC. To contact the institute, call: (888) 604-5752, ext. 250, or visit the Web site: http://www.inclusionresearch.org.

The National Arbor Day Foundation Announces Annual Poster Contest

The National Arbor Day Foundation (NADF) is inviting 5th grade classrooms across the country to showcase their artistic talent–while learning about trees– with its annual Arbor Day National Poster Contest. The theme is *Trees are Terrific...inside and out*. Students are encouraged to show off their creative flair by designing a poster to reflect this theme.

The winner of 2002 poster contest will be announced on Arbor Day (April 26, 2002). The first place winner, his or her parents and teacher will receive an expense-paid trip to Nebraska City, NE, where they will participate in the National Awards Weekend in addition to receiving a $1000 savings bond and a lifetime membership in the NADF. The winning student's teacher will receive $200 for classroom materials. Second and third place also receive savings bonds and funds for classroom supplies. To receive a free activity guide on how trees function, including in-depth lesson plans, educators can sign up by writing to: NADF, P.O. Box 85784, Lincoln, NE 68501-5784, or by sending an e-mail to: education@arborday.org.

Technology and Persons with Disabilities

The 17th annual conference *Technology and Persons with Disabilities*, sponsored by the Center on Disabilities, California State University, Northridge, will be held March 18-23, 2002 in Los Angeles. Gregg C. Vanderheiden, a pioneer in the field of augmentative communication and assistive technology, will be the featured keynote speaker. For additional information, contact: Conference Staff, Center on Disabilities, California State Univ. Northridge, 18111 Nordhoff St., Northridge, CA 91330-8340; Phone/TTY: (818) 677-2578; Fax: (818) 677-4929; E-mail: ctrdis@csun.edu; Web Site: http://www.csun.edu/cod

NOTATIONS

- Linda Thomas, author of *Living with Prader-Willi: The Starving Syndrome*, would like to acknowledge the assistance of Theresa Strong, PhD, chair of the Scientific Board of the Prader-Willi Alliance for Research, who "provided invaluable contributions to the technical content of the article." This feature can be found on page 66 of the November 2001 issue.

- In *Remembering Malki* (December 2001, page 62), we failed to include contact information for The Malki Foundation; this non-profit provides essential and practical assistance to families in Israel caring for children with severe disabilities so that their child can remain at home for care as long as possible. Web site: http://www.kerenmalki.org; Phone: (508) 462-8555; Mail: Attn: Frimet & Arnold Roth (AFKM), PO Box 23637, Jerusalem 91236 ISRAEL.

PREVENTABLE DISABILITIES!

Dear Parents:

When my son was born with cerebral palsy, my family and I had no idea how our lives would be affected. We did not see how vulnerable our child was and how he would need our care and protection for the rest of his life. We did not understand that we would become his life-line in so many ways, and he in turn would consume our lives.

As an attorney, I have become deeply involved in brain injury and other birth injury cases throughout the country.

We would be interested in looking into your child's birth if you had complications either during pregnancy, during delivery, or after delivery.

Our medical staff includes a board certified obstetrician and a registered obstetrical nurse.

Please call 1-800-888-LAWS and speak with either an attorney or a registered nurse.

Remember, there are time restrictions.

Sincerely,

Sheldon O Zisook

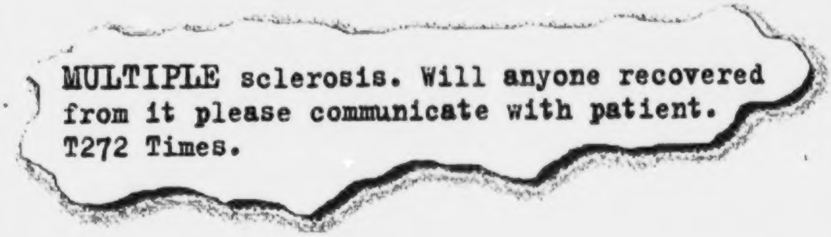
Courage

by Richard Trubo
Ivan R. Dee, Publisher, Chicago
Pages: 320 • Price: $27.50
Review by Jerry Levinson



MULTIPLE sclerosis. Will anyone recovered from it please communicate with patient. T272 Times.

Courage, as defined by Webster's Dictionary, is "the attitude of facing and dealing with anything recognized as difficult, or painful, instead of withdrawing from it; also the courage of one's convictions to do what one thinks right."

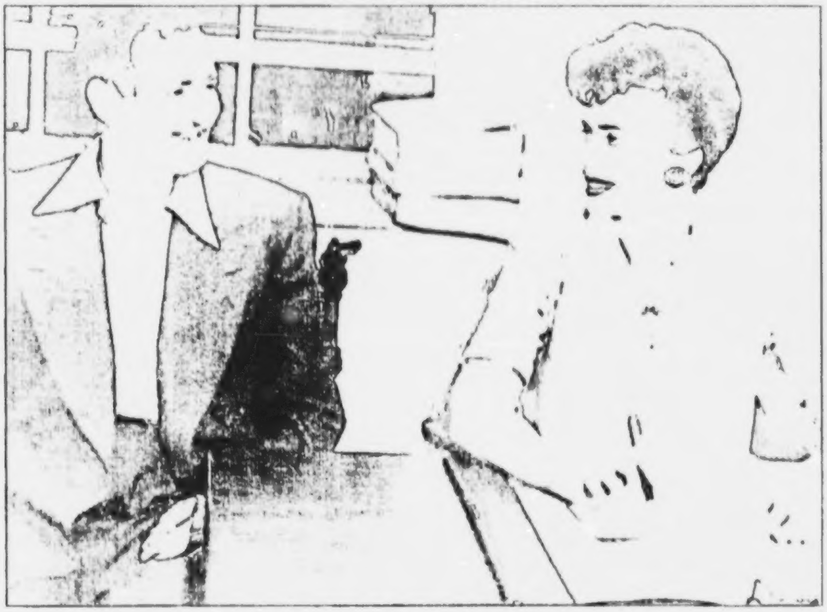
The definition perfectly describes the character of Sylvia Lawry, the woman who founded the institution that is today known as the National Multiple Sclerosis Society (NMSS). The word defined is also the title of the book chronicling her efforts.

In *Courage*, author Richard Trubo tells how Lawry, whose brother Bernard was diagnosed with MS in the 1930's, put her own dreams on hold, deciding that the defeat of the disease would be her life's work. As the Acknowledgements to the book recite, her commitment to defeating MS was her "magnificent obsession."

Once the initial shock of her brother's diagnosis subsided, Lowry began to investigate the cause or causes of MS, and whether there was a recommended treatment and cure for the disease. To her dismay, at the time little to nothing was known about the condition. Even more disheartening, many doctors would not see, let alone treat, people with MS, believing nothing could be done to help them. It was not uncommon for people with MS to be given a prognosis of five years to live, maximum.

For those with MS, the absence of information about the disease and the bleak outlook for the future were compounded by the almost total absence of research into the disease and lack of funds devoted to that purpose. There was nowhere for MS patients and their families to turn for answers, and little reason for optimism.

Courage describes how Sylvia Lawry refused to accept this black hole of information about MS, and tells how her novel and unconventional step of advertising in the *NY Times* for information about anyone who had "recovered" from the disease led to the realization that many individuals with MS wanted more information, research and hope. The book then depicts how she worked tirelessly to form the Association for the Advancement of Research on Multiple Sclerosis (the predecessor of the NMSS). She assembled the organization's medical advisory board and obtained funding for the organization's research and patient-assistance efforts by increasing public awareness of the disease—a not-inconsiderable achievement at a time when the majority of the public had never even heard the words "multiple sclerosis." As *Courage* recounts, Lawry's accomplishments are all the more astonishing because they "occurred in an era when women were not taken seriously enough."

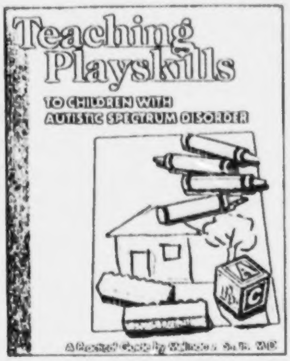


Sylvia Lawry with her brother, Bernard.

Sylvia Lawry died in March 2001. However, her determination, persistence and entrepreneurship created a living legacy of MS societies in every state of the union and throughout the world, organizations that are devoted to promoting research into the cause and treatment of the disease, assisting MS patients and their families, and eliminating the devastating effects of MS. *Courage* details Ms. Lawry's efforts to end MS and form the NMSS by describing each step in her personal efforts to ultimately conquer this baffling disease.

Sylvia Lawry

Jerry Levinson is an attorney and president of Benefits Research & Communications, Inc. of San Diego, CA. He is also editor of Aspen Publishers' Journal of Compensation and Benefits Management. He is a graduate of Boston College and lives with his wife Dorothy and three sons in San Diego. Jerry has had MS for 33 years.



Teaching Playskills to Children with Autism Spectrum Disorder

by Melinda J. Smith, M.D.
Published by DRL Books
New York, 2001
Available from the EP Library
(800) 535-1910
Code: DR6635AT
Cost: $24.95 plus shipping and handling.

Drawing on her experience as a mother of a child with autism spectrum disorder (ASD), author Melinda Smith, MD narrates *Teaching Playskills to Children with Autism Spectrum Disorder* from a concerned, observational standpoint motivated by her struggle to guide her son's playskill development. The project started in 1999 as a culmination of her research and personal experience; she created the Web site *Teaching Playskills to Children with Autism Spectrum Disorder*, http://melindasmith.home.mindspring.com. After confirming her child's diagnosis with extensive research, Smith embarked on a two-year journey of Applied Behavioral Analysis (ABA) therapy; her book reflects that process and includes notes by her son's tutors in almost every chapter. Also included are excerpts from other parents coping with ASD; these anecdotes are helpful and revealing, drawing contrast to the experiences of Smith's son. Because this is Smith's first experience with ABA, the reader benefits from her true-to-life narrative, experiencing common pitfalls and unexpected insights alongside her. She gives tips for planning, building and guiding your child's play, as well as suggestions loosely based on her own experiences. Smith wisely includes pros and cons for most techniques, approaches or exercises and is ever mindful that ASD can manifest in a variety of ways in different people.

Informally organized, the book first addresses the issue of play, its role in a child's cognitive and social development, types of play and teaching playskills to a child with developmental delays. Smith describes the "mythical child" –which parents too often glorify– that picks up his toys and who doesn't make too much noise; the autistic child, Smith opines, is just "more," that's all.

The next ten chapters, the bulk of the book, describe, evaluate and exemplify differing modes of play. With personal narratives, tutors' notes and outside excerpts, Smith explores what works and what doesn't and why; how to deal with inappropriate behavior; the relative worth of a playskill unmastered versus a child's peace of mind; peer involvement and its value; and hundreds of ideas to initiate play with your child.

Play is organized into the following groups: imitative, manipulative, toy, in-vivo pretend, in-vitro pretend, game, musical, sensory/physical, water/sand, and creative. Drills, techniques, targets, materials, examples, types and rules are included.

Smith takes the last four chapters to address social forms of play. Drawing a distinction between playdates (one or two peers) and playgroups (several peers), Smith gives prerequisites, goals and warnings, addressing difficult peer issues such as dealing with other people's children and their rudeness and lack of response to your child; the stigma among children that is associated with pretend play, viewing it as "babyish"; and your child's lack of attention span. Smith gives advice on how to build a playdate "pool" that nurtures your child. For example, peers from therapy and their siblings, who are often "accustomed to special needs behavior," often make excellent playdates. Making connections like these can help to reincorporate your child's siblings into play, since, Smith notes, they can become estranged from the sibling relationship when ASD is present. The final chapters focus on the transition of play to older groups, where structured games can become powerful. Some fun recipes for slime and putty are included along with a bibliography and a listing of toy companies and their products.

Taking The Next Step Together

Moving forward... a new location... a whole-hearted vision

THE THIRD ANNUAL WORLD CONGRESS & EXPOSITION ON DISABILITIES

SHOW DATES:
Thursday, Friday & Saturday—October 3 - 5, 2002
LOCATION:
Orange County Convention Center—Orlando, Florida

A UNIQUE GATHERING—A Disability Conference and Trade Forum, bringing together families and professionals all under one roof. Orlando, one of the world's most popular vacation destinations, is the perfect setting for this coming together. The WCD will attract

physicians • families ○ direct support professionals ○ people with disabilities ○ allied health care professionals • educators ○ adapted physical education specialists.

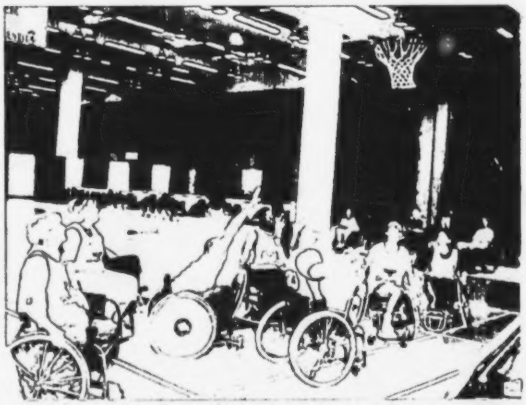
TRADE SHOW: Meet with over 250 exhibitors including product & service providers, organizations, manufacturers, retailers, home medical equipment dealers, distributors, long term care, rehabilitation and extended care facilities.

SPECIAL FEATURES

SPORTS & RECREATION ACTIVITY CENTER: Features top athletes with disabilities in basketball, tennis, rugby, soccer, track and field and more.

EMPLOYMENT SYMPOSIUM PAVILION: Human resource managers will discuss career opportunities.

FAMILY, PROFESSIONAL AND GOVERNMENT ORGANIZATIONS: Meet with over 30 national and regional organizations, non-profit associations and professional societies.



CONFERENCE PROGRAM: Comprehensive, multi-disciplinary approach to education. Seminars will focus on medicine, education, family issues, advocacy, assistive technology, adapted physical education and career/employment.

- All WCD attendees can experience discussions by internationally renowned experts specializing in neurology, orthopedics, pediatrics, internal medicine, family medicine, physical medicine, epidemiology, DDS, movement disorders, mitochondrial and metabolic disorders, neonatology, seizure disorders, autism, and other disabilities and chronic conditions as well as general practitioners.
- CME and CEU accreditation will be provided through approved accreditation institutions.
- Hear parents and professionals share strategies and techniques for planning and problem-solving in the home, the family, the community and the world at large.
- An Employment Symposium produced in conjunction with the Florida Department of Education, Division of Vocational Rehabilitation Services will offer sessions for people with disabilities, their families and employers.
- Learn from special education professionals what is going on in classroom environments.
- Participate in adapted physical education activities and seminars.

October 3-5, 2002 ○ WORLD CONGRESS & EXPOSITION ON DISABILITIES

Third Annual WORLD CONGRESS & EXPOSITION ON DISABILITIES Gears Up For Exciting Move To Orlando

The Second Annual World Congress & Exposition on Disabilities (WCD) that took place September 28-30, 2001 in Atlanta was a major success. The event drew more than 5,000 people from across the country and received high praise from attendees and exhibiting companies.

"The World Congress & Exposition on Disabilities was one of the most rewarding events I have ever attended. It really was a two way street between us and our patients because I learned as much or more from them as they did from me. The WCD was both an educational and motivational experience for me," said John Knudsen, Shire US Inc.

Produced by H.A. Bruno, LLC, the WCD is a comprehensive forum that educates, informs, and provides a useful exchange of ideas for persons with disabilities and special health care needs, as well as those involved in their care and development. Attendees at the WCD include physicians, physical therapists, occupational therapists, social workers, speech and language pathologists, nurses, special education and adapted physical education teachers, direct service providers, people with disabilities and their families and caregivers.

In 2002, the WCD will take place at the Orange County Convention Center in Orlando, Florida on October 3-5. "We're very much looking forward to moving the event to Orlando," stated Steve Gross, Director of the WCD. "The reception we have received from many local and state disability groups, as well as some state government organizations has been incredible."

Florida Governor Jeb Bush will be the Guest Speaker at the WCD this year. The impressive list of invited keynote presenters include Bob Pasternak, the new Assistant Secretary of the US Department of Education from the Office of Special Education and Rehabilitation Services; Dr. Robert Steadward, past President of the International Paralympic Committee; and Dr. Francis Collins, Director of the National Human Genome Research Institute.

The WCD will continue its incredible conference by offering over 150 sessions. The uniqueness of this program is the multi-disciplinary focus. Each seminar is designed to educate many disciplines within the disability community. The conference program is sponsored by the EP Foundation for Education, Inc., a 501(C)3 not-for-profit organization, with the assistance of EP ("Exceptional Parent") magazine. From pediatrics to geriatrics, some of most important issues and topics in the disability arena will include: autism, ADD/ADHD, dystonia, epilepsy, estate planning, genetic disorders, IDEA, learning disabilities, movement disorders, newborn screening, perinatal care, spasticity and The Medical Home. An adapted physical activity program will offer sessions on sensory and gross motor activities, biomechanics for inclusion in PE as well as extracurricular and after-school activities. A special focus on assistive technology will be added to the educational program with topics and presenters from CSUN. In addition, collaboration on a 50 session employment symposium with the Florida Department of Education, Division of Vocational Rehabilitation Services (VRS) and other statewide provider/advocacy organizations rounds out the conference.

The exhibit floor will once again host a wide array of the latest, products and services from more than 250 exhibitors

☐ Read updated news items
☐ Communicate with people in the disability community
☐ Use the comprehensive bulletin board

representing many industries. The majority of exhibitors from last year are returning, some of which include Sigma-Tau Pharmaceuticals, Advanced Respiratory, Ford Motor Company, McDonald's Corporation, Guldmann, Shire US, Pride Mobility, The Liberty Motor Company, Allergan Pharmaceuticals, Pathways Design, Theradapt, Flaghouse and Magitek as well as many others in the pharmaceutical, assistive technology, automotive, mobility, durable medical equipment, personal care, insurance, computer, nutrition and many other industries. Some of the exhibitors include Convaid, Sunrise Medical, Ricon and Bodypoint Designs offering their strollers, wheelchairs and other mobility products; Acorn Stairlifts; Economic Mobility and Anew with personal care products; Sammons Preston; Hewlett Packard; and many more. Along with its employment symposium, the VRS is working closely with the WCD in producing a major disability employment pavilion on the show floor.

And... back by popular demand... The Sports & Recreation Activity Center promises to be a major attendee attraction. Activities such as basketball, tennis, fencing, rugby and track and field will take place right on the show floor and professional demonstrations will be followed by audience participation.

Sponsoring organizations have always played a critical role in the WCD. Through their efforts, the significance of the WCD for the disability community is disseminated. Over 30 national and regional organizations are sponsoring the event, most of which will also be at the show to discuss their goals and how they can best support those in need. Some of those participating are the National Institutes of Health, Muscular Dystrophy Family Foundation, Special Olympics, American Academy of Pediatrics, National Multiple Sclerosis Society, TASH, American Association on Mental Retardation, WE MOVE, Council for Exceptional Children, UCP, Family Voices, Spina Bifida Association of America, National Parent Network on Disabilities, Child Neurology Society, American Association for Active Lifestyles & Fitness, National Perinatal Association, and AAUAP.

Sponsoring publications are also important to this national event. EP ("Exceptional Parent"), PALAESTRA, New Mobility, Today's Caregiver, Disabled Dealer of the Southeast, Active Living Magazine and Teaching Exceptional Children are just some of the magazines currently supporting the WCD.

Effective Social Skills Programming

The May Institute, Inc.

This article has been developed for parents of children with difficulties in social interactions. In particular, parents of children with special needs—mental retardation, pervasive developmental disorders (PDD) and other disorders where social behavior is of concern—may benefit from the information presented here on promotion of social skills in young people.

Good social skills are important tools for day-to-day living; they help children navigate social interactions effectively and smoothly. The most basic and essential skill is the ability to communicate with others. Social skills are the specific behavioral strategies that allow one to initiate and maintain positive social interactions with others, develop friendships and social support networks, and cope effectively with the social environment.

> As with academic subject matter, social skills can be taught, both at home and in school.

Children have many important social relationships to negotiate:

With parents and direct support professionals (DSPs): they must be able to follow directions, sit quietly when needed, assist with household chores and self-care as possible, and communicate needs in an appropriate way.

With teachers: they must be able to respond to teachers' behavioral expectations.

With peers: they must meet the behavioral requirements of peers in free play settings.

Importance of promoting social skills and prosocial development

Studies have demonstrated that a child's social competence is a critical developmental achievement for later social success. Social competence has been strongly associated with successful school performance, transition into school and work settings, better job opportunities and corresponding adult support, and improved overall interactions with others. Without intervention, children who demonstrate poor social skills may continue to experience problems into middle childhood and beyond.

Children with good social skills are better accepted by their peers, have better coping and attention skills and make better adjustments to school and social situations. Children with poor social skills have a greater risk of developing patterns of aggressive behavior and experience higher rates of emotional and behavioral problems. Developmental delays, however, affect the ways children demonstrate and develop social skills.

People with mental retardation show impairment in at least two adaptive skill areas such as communication, self-care, home living, social skills, community use, self-direction, health and safety, functional academics, leisure, and work.

There are several ways in which people with PDD may be weak in social skills.

Qualitative impairment in social interactions: People with PDD may have impairment in the use of such nonverbal behaviors as eye gaze, posture, facial expression or gestures; or they may fail to develop peer relationships appropriate to their developmental level. They may not understand social and/or emotional reciprocity and generally do not spontaneously seek to share their interests and achievements.

Restricted, repetitive, and stereotyped behaviors, interests, and activities: There may be preoccupation—abnormal in intensity or focus—

with one or more restricted, stereotyped interests. People with PDD may demonstrate inflexible adherence to specific, nonfunctional routines or rituals, stereotyped or repetitive motor mannerisms, or persistent preoccupation with parts of objects.

Qualitative impairment in communication: This may be a delay in or total lack of the development of spoken language. If speech is adequate, there may be an impaired ability to initiate or sustain conversation. Stereotyped and repetitive use of language and idiosyncratic language are common, as is lack of varied, spontaneous pretend play or social imitative play.

Social Skill Deficits

With an acquisition deficit, the child does not know how to perform particular skills. For example, Jack stands by the wall while watching a circle of his friends; he wants to join in but doesn't know how to start the process. A child with a performance deficit has the skill but does not use it. So Jim can raise his hand in class, but instead he yells out to get his teacher's attention.

There are both formal and informal ways to help children with social skill deficits. Formal interventions for this purpose are usually called "social skills programming."

Developing Effective Social Skills Programming

Social skills programming is a psychological and educational intervention for students with social skill deficits; it is used to strengthen social interactions and improve self-control. As with academic subject matter, social skills can be taught,both at home and in school.

FOUR KEY AREAS

1.Social Skills Assessment

The first step in developing effective social skills programming is an assessment of your child's social skills, both strengths and deficits; it identifies areas to be worked on. As mandated by the Individuals with Disabilities Education Act (IDEA '97), school-aged children with developmental delays are required to have an Individualized Education Plan (IEP) that specifies the services necessary for a student's successful performance in a given setting. An assessment will thus provide guidance for this portion of the IEP.

> Your child's social competencies will be compared to those of "typical" students, allowing parent and others working with the child to understand better the child's progress in developing age-appropriate skills.

Measurement Strategies

Informal observations and feedback from a parent, DSP, and other people who know your child very well can offer helpful information about his current skill level in areas such as joining an activity and asking for help in appropriate ways. **Formal assessment strategies** help to provide objective information about how a child's current abilities compare with those of her peers. Tools have been designed to test cognitive and intellectual ability, adaptive functioning, personality measurements, functional behavioral assessments, and others.

Empirically-based assessments are developed through careful testing with the targeted population. Testing is often conducted with a large number of children of various ages, backgrounds, and abilities to determine whether the assessment measure or tool is reliable and valid for understanding children's patterns of behaviors. Reliability means that the assessment tool consistently provides the intended information in an accurate fashion. Validity means that the test really does measure what it is supposed to measure: intelligence, social competence, achievement, etc.

Advantages of Using Empirically-Based Assessment Measures

Your child has both strengths and weaknesses in of social skills. These assessments will measure them more precisely. Your child's social competencies will be compared to those of "typical" students, allowing parent and others working with the child to better understand the child's progress in developing age-appropriate skills. Children commonly show different behaviors and skills when in different settings with different care providers, so social competencies as evaluated by different observers can be compared. By using the same assessment tool to track progress, parents and teaching staff can determine if the social skills intervention is working or if there are areas needing additional intervention.

Functional Behavioral Assessment (FBA) is one type of formal evaluation. For those students with challenging behavior, a functional behavioral assessment may be necessary. FBA is a process for gathering information that can be used to maximize the effectiveness and efficiency of behavioral support because the problem behavior is evaluated in context. An FBA is a means for understanding the

continued on page 34

continued from page 33

antecedents and consequences associated with social skill deficits by providing information about when, where, and why problem behaviors occur. The underlying rationale of the process is the assumption that behavior is functional: individuals engage in patterns of behavior that work for them in some way; there is a logic to the target behavior, and functional assessment is an attempt to understand that logic. By looking at the relationship between behavior and a child's environment—schedules, activity patterns, curriculum, teachers, physical settings—we can identify clues about the factors that support the target behavior.

Several strategies are used to conduct an FBA, including interviews and direct observation. This type of assessment is especially helpful when there is no agreement about the processes that appear to maintain the behavior. An FBA is especially needed when severe problem behaviors are a concern; IDEA '97 now requires that an FBA be conducted for any child who is suspended from school for more than 10 days because of behavioral problems.

Answers to specific questions help to inform an FBA evaluation:

- ***What are the behaviors that are causing concern?***
- ***What events or physical conditions that occurred significantly earlier in time than the problem behavior increase the likelihood that the problem behavior will recur?***
- ***What events and situations that occur just prior to the problem behaviors reliably predict occurrence of problem behaviors?***
- ***What events reliably predict when problem behaviors will not occur?***
- ***In a specific situation when the problem behavior occurs, what are the consequences that appear to maintain the problem behavior?***
- ***What appropriate behaviors, if any, could produce the same consequences that appear to maintain the problem behavior?***

Priorities for immediate intervention

Behaviors that are physically dangerous; would enable the student to have better access to more inclusive activities; provide a positive approach; are precursors to later, more complex skills; or alter the perceptions of others and thus have long-term positive implications are priorities for intervention.

2. Curriculum Selection and Implementation

The second key in developing effective social skills programming is selecting a well-designed social skills program that will address your child's deficits. The results of the social skills assessment should help guide the decision-making and selection process.

What to look for in a social skills curriculum or program

Numerous social skills curricula are available on the market (see Resources). A validated social skills curriculum has been research-tested and found to be effective for improving social skills. Implementing a social skills curriculum will require time and effort on the part of many people who work with your child; select a program that you can be confident will bring about the needed

A Summary Checklist

Assessment

☐ 1. An assessment has been conducted to measure my child's social skills.
☐ 2. Standardized, empirically-based measures are used to assess my child's social skills.
☐ 3. Results provide information about my child's social skill deficits and strengths.
☐ 4. If my child exhibits challenging behaviors, Functional Behavioral Assessment is conducted by a qualified professional.

IEP Development

☐ 1. Goals and objectives target specific social skill deficits.
☐ 2. Goals target priority areas for intervention.
☐ 3. Goals and objectives are measurable.
☐ 4. Goals allow for change over the course of a year.
☐ 5. Goals and objectives include measurable benchmarks.
☐ 6. Data collection systems are in place to measure progress toward each of the goals and objectives.
☐ 7. Changes are made to social skills programming or goals as indicated by the data.

Social Skills Programming

☐ 1. Social skills programming is matched to the target areas for which my child needs intervention.
☐ 2. For direct skill instruction, key features are incorporated: modeling, coaching, role-playing, performance feedback, reinforcement, and

regeneralization procedures.

☐ 3. If a curriculum is used, it is one that has been validated.

☐ 4. Includes instruction for skills that are useful at home

Staff Qualifications

☐ 1. Consultant is qualified to develop appropriate social skills programming based on assessment results and needs of my child.

☐ 2. Staff are qualified to implement social skills programming.

☐ 3. Staff who implement social skills programming are knowledgeable in mental retardation and/or pervasive developmental disorders, functional behavioral assessment, social skills assessment, best instructional practices, applied behavior analysis, social skills training, and behavior support plans.

☐ 4. The behavioral consultant has the qualifications in applied behavioral analysis and school consultation necessary to address your child's needs.

☐ 5. The behavioral consultant is part of the team of providers and monitors and provides feedback to me and the staff about program progress and needed modifications.

Parent Involvement

☐ 1. We have discussed concerns about our child's social skills deficits.

☐ 2. We are invited to, and attend, each planning meeting.

☐ 3. Our opinions are solicited and valued at these meetings.

☐ 4. The plan reflects our input.

☐ 5. All parties work toward generalization of our child's skills at school. and at home.

changes in your child's social skills and behavior. A validated curriculum can provide that confidence, focusing on social skills development in areas that include pragmatic language development; flexibility in managing tasks, settings, etc.; attention skills and adaptive behavior.

The materials used to teach social skills should be as similar as possible to materials used in real life—this can result in a greater transfer of skills because the instructor can tailor the lesson to the needs of the student or class. Depending on the assessment results, social skills programming can occur on a daily, multi-day, or weekly basis; its duration should be adjusted based on developmental level, attention span, interest, and maturity level.

Implementing a social skills curriculum

The curriculum may be implemented in many different ways, depending on the needs of the child and the target skills to be addressed. Instruction can be carried out at the district, school, classroom, and individual levels or in some combination; social skills programs can be conducted with whole classrooms, small groups, or on a one-on-one basis.

Often, children will not learn social skills just from being given an opportunity to interact with peers. Like any other skill, children need to be taught what to do—and when to do it.

Teaching Social Skills

There are several different approaches to teaching social skills. Some children learn as a result of incidental teaching. This is when children learn about social skills and how to do them through their own observations of others and the interactions they have with others in their natural environment. An example would be receiving reinforcement from the teacher for demonstrating a particular skill. Other approaches—peer-initiation strategies, peer tutoring—involve a child's peer network. A socially competent peer is paired with a child needing social skills; the goal is to assist the child in developing or refining a particular skill.

Some children can only learn social skills through direct skill instruction. This kind of instruction involves a direct and systematic way of teaching a social skill or behavior and can involve a curriculum that is used to teach various skills. Research has identified the critical features of this approach that will be most effective in bringing about long-lasting change and improvement. Studies have also found that there is a direct relationship between the amount and quality of social skills training and the extent of behavior change.

FEATURES OF DIRECT SKILL INSTRUCTION

Modeling and coaching: Children are shown examples of people (models) performing behavioral steps competently.

Role Playing: Children need to be provided with numerous opportunities to practice new skills.

Performance Feedback and Reinforcement: Children need to receive frequent feedback and positive reinforcement—praise, reward plans—for demonstrating skills to make it worthwhile to use them. The improved behavior must occur frequently enough so that reinforcement can be given. Through this process, chil-

continued on page 36

What Can a Parent Do?

At Home

Look for and find appropriate behavior;
Define and quantify the behavior operationally;
Use reinforcement;
Take advantage of natural opportunities;
Try to ignore inappropriate behavior;
If needed, find a competent behavior analyst to help you;
Look at the long-term;
Prepare for transitions.

At School

Do you know whether your child is making progress? "Show me the outcomes."
Has the school asked you what you think is important for your child?
Have you indicated what are you long-term goals?
What is your child's curriculum?
Ask yourself: "How can I help the educational staff working with my child?"
Attend meetings;
Communicate, COMMUNICATE, **COMMUNICATE!**

continued from page 35

dren should understand why to use the skill and with whom; what skill should be chosen; when and where to use it; how to perform the skill; what to do if the skill is unsuccessful.

Generalization: In order to increase the strength of a social skills intervention, a number of service components should be in place to promote skill acquisition across settings. When a child begins to demonstrate success in using a skill across different settings or with different individuals, generalization of the skill has occurred. Generalization of social skills is improved when programming is conducted in the settings where the skills need to be performed, with different examples and models, involving socially competent peers.

The program should include teaching the difference between appropriate and inappropriate skills and teaching the child self-management of the behavior when possible; efforts should be coordinated with school staff. Transfer training refers to the specific procedures that are designed to help build generalization, such as the teaching setting, materials, personnel, reinforcement systems, and task instruction.

3. Program Monitoring and Evaluation

The third key to developing effective social skills programming is to monitor and evaluate program outcomes to determine whether the intervention is working. This step also involves identifying personnel who will monitor, evaluate, and communicate program progress over time.

The people monitoring behavior should look for instances when the skill is demonstrated, then assess the child's mastery and fluency of usage of the target skills. Data collection can involve both formal and informal observations and assessments using empirically-based rating scales or surveys. Ongoing data col-

With the Creepster Crawler, You Can Watch Your Child Crawl for the First Time!

Children lacking head control, the ability to roll over or belly crawl have gained mobility with the ***Creepster Crawler.*** Using this light, innovative device, hundreds of children around the world are crawling, working more productively with their therapists, and gaining a head start to more advanced mobility in the future.

The ***Creepster Crawler*** is an ideal solution for youngsters with debilitating conditions such as ☐ Spina Bifida ☐ Down Syndrome ☐ Cerebral Palsy ☐ TBI, and ☐ developmental delays. Children with tracheostomies and G-Tubes also are successful users of the ***Creepster Crawler***.

The ***Creepster Crawler***'s frame has a padded platform that can support a parent or therapist from above, making it easier to work with the child on weight-bearing, weight-shifting, reaching and creeping. Front shoulder, chest and rear straps can be adjusted for individual fit.

Please visit our Worldwide Web site at www.red-enter.com for additional details and a video demonstration of the ***Creepster Crawler***.

lection allows team members to track progress on a daily, weekly or biweekly basis. This level of monitoring can allow staff to quickly identify progress and/or areas in need of improvement in order to ensure the rate of student progress to meet annual goals.

4. Staff Competencies

The final key to developing effective social skills programming is to have staff, support personnel, and case consultants who are adequately trained with the competencies needed to develop, implement, monitor, and evaluate programming. Individuals who provide social skills programming for students with developmental disabilities should be competent in the use of applied behavior analytic procedures.

Applied behavior analysis (ABA) is a highly individualized method of instruction based on scientific principles of learning theory. It is used to design student programs that are implemented systematically, evaluated empirically, and introduced within natural environments. This method has been validated by more than 25 years of research as the most effective way for individuals with and without disabilities to acquire skills, increase socially useful behaviors, and reduce problematic behaviors.

Competencies should include knowledge of:

- Mental retardation, PDD, and other developmental delays;
- Assessment: FBA, social skills assessment;
- Best instructional practices;
- Applied behavior analysis;
- Social skills training;
- Behavior support plans. **EP**

Safety of your child with a disability

By Cema Mastroleo, MEd, and Wendie H. Abramson, LMSW

Parents want their children to be safe from accidents, illnesses, physical harm, bullying, drugs, etc. In considering our children's safety, preventing abuse is essential.

We have a key role in protecting our children from abuse whether our child has a mild or severe disability. Parents can be proactive in preventing victimization by teaching about personal safety. It is also important to help our kids build awareness of their emotions and personal boundaries.

Teaching our children about personal safety is an ongoing process and following are some suggestions for tackling this issue. These tips can be adapted to your child's learning needs.

Feelings - Discuss feelings (e.g., happy, scared, angry, safe, confused) and provide examples of situations when people may have these feelings.

Touches - Identify various types of touches—touches that are appropriate (e.g., a goodnight kiss from mom, high fives with friends, medical check-ups) and touches that are not okay (e.g., pulling hair or touching other's private parts without permission).

Safety planning with your child – Discuss possible safe ways to respond to hurtful or dangerous situations. Examples include leaving the situation, yelling for help, saying "No!" and telling trusted adults. Have your child identify who they trust.

> If your child uses a communication board or other augmentative communication device, the device may need to be updated with words or symbols for communicating about personal safety.

Rights - Talk to your child about her rights. Allow her to make choices and to tell you "no" sometimes. If someone tries to hurt her, she will have had practice saying "no."

Secrets - Talk about "fun" and "special" secrets. A surprise birthday party is a "fun" secret and is okay not to tell. "Special" secrets are hurtful (e.g., an adult fondling a child and making a threat if the child tells). A child needs to tell trusted adults if someone asks them to keep a "special" secret.

Social behaviors - Teach your child about behaviors that are socially acceptable in public (e.g., shaking hands) versus private places (e.g., changing clothes).

Values – Teach your child about family, cultural or religious values about sexuality and relationships.

Sexuality/Puberty – Discuss the medical terms and functions for all the body parts (including the private parts for males and females). As puberty approaches, talk about normal body changes for boys and girls.

Personal care - If your child needs personal assistance with hygiene at school, check if the bathroom doors close or if there is a curtain around change area. Make sure you and your child are comfortable with staff responsible for your child's hygiene.

School - Ask your child's school to provide abuse prevention, sexuality education and personal safety drills to reinforce the concepts taught at home.

Disclosure of abuse - If your child tells you about abuse, seek medical attention if necessary. Call 911 if there is current danger.

Suspicions of abuse - Report any suspicion of abuse, neglect or exploitation to the local police department and child protective services.

Support - If your child has been abused, consider seeking counseling for your child with a therapist or rape crisis agency. This may help him heal from the trauma.

Communication - If your child uses a communication board or other augmentative communication device, the device may need to be updated with words or symbols for communicating about personal safety. Other possibilities may include a switch with a pre-recorded message, whistle or other personal alarm device for signaling emergencies.

Talk to your child about her rights. Allow her to make choices and to tell you "no" sometimes. If someone tries to hurt her, she will have had practice saying "no"

Personal care providers - When hiring personal care providers, be clear about your expectations, check references, do background checks and offer the employee ongoing supervision and feedback.

Internet - If your child uses the Internet, instruct her not to give personal information to anyone.

Other providers - If your child lives in a group home or institution, get to know the direct care staff and administration. Visit often. Trust your instincts and address your concerns if you think there may be problems.

Modeling - Be a role model by using non-violent discipline.

It is helpful to take advantage of natural teaching moments and to build upon safety information as the child grows and develops (e.g., dating, sexual relationships, managing personal care attendants).

SafePlace's Disability Services offers informational fact sheets and materials on topics related to healthy relationships, sexual health, sexuality education and abuse prevention through its' International Resource Lending Library. Visit: http://www.austin-safeplace.org or call (512) 267-7233 for information. **EP**

Wendie H. Abramson, LMSW is the Director of SafePlace's Disability Services ASAP (A Safety Awareness Program) in Austin, Texas. The statewide program that she oversees offers outreach, abuse prevention education and crisis intervention geared toward persons with disabilities.

Iracema "Cema" Mastroleo, MEd is a Disability Services ASAP educator at SafePlace and provides abuse prevention and personal safety workshops for children with disabilities, their families and professionals. Ms. Mastroleo has over 20 years experience working with children and adults with disabilities in both the United States and Brazil.

Early Warning

Early childhood is a time that is marked with important milestones in development. It is also an opportune, if not critical, time for helping a child with a disability to make improvements in areas where there are deficits. In these articles, two mothers discuss the impact of early intervention and support in their families' experience with apraxia of speech (also known as developmental apraxia of speech, verbal apraxia or dyspraxia), a neurologically based disorder affecting the ability to plan, execute and sequence the movements needed for speech.

Dealing with A Parent's Worst Nightmare

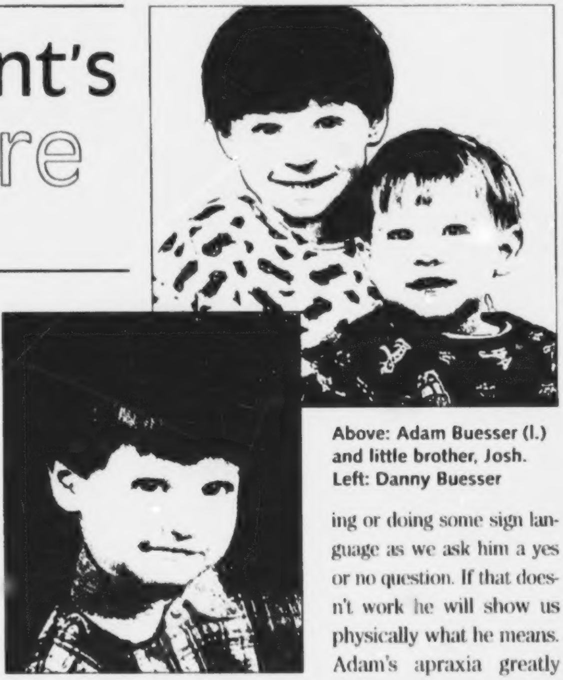
By Jeanne Buesser

When my husband, Raymond, and I chose to become parents, we jumped into the unknown. Our children's well-being and happiness became our concern. The first of our three sons, Danny, was a healthy, very active boy. He was a very independent child, smart beyond his years.

Our second son, Adam, was born 2 1/2 years later. Adam was a big baby like his brother, with no obvious problems at birth, although his tongue stuck out and his cheeks sagged a little. No one thought there was a problem, except that Adam never babbled or made sounds as an infant. We just thought he was a quiet child.

How quickly life can change, though. When he was a little more than 3 1/2, Danny contracted Burkitt's lymphoma, a rare fast-growing cancer with few symptoms. This virtually silent killer took the life of our son within hours of his diagnosis. We were devastated, in shock, unable to comprehend how we as parents couldn't save our child. We asked, "Why did we deserve this? Why us?"

Ten days after Danny died, I joined a group called The Compassionate Friends, a bereavement support group for parents experiencing the death of a child. It was the one place I felt I could express my grief and lean on others who had similar tragedies. I learned the benefit of being with others who could share ideas for living. I became the librarian and facilitator of my local chapter. I discovered that whatever positive support and energy you give to others will return to you three-fold.



Above: Adam Buesser (l.) and little brother, Josh. Left: Danny Buesser

A new start, more challenges

In our grief, we weren't overly concerned that Adam still wasn't talking; we were trying to deal with Danny's death. Wanting to make a new start, we sold the house and moved to another. It wasn't until Adam was 2 years old that a neurodevelopmental pediatrician diagnosed him with a neurological speech disorder called apraxia of speech.

Children with apraxia of speech are unable to produce the sounds for speech so as to be understood, despite having the ability to do so. Intelligence level in most children with apraxia is unaffected. For example, Adam can put together 60-piece puzzles without ever having seen them before. He has a picture-perfect memory, and can approximate the picture to the puzzle box. But it is also very frustrating for him. Adam will have tantrums because he can't respond to our questions with intelligible speech. Adam makes his needs known by pointing or doing some sign language as we ask him a yes or no question. If that doesn't work he will show us physically what he means. Adam's apraxia greatly limited his circle of friends. No one could understand what he wanted and few children wanted to play because he was "different."

For Adam, as for most children with apraxia, intensive speech therapy was key in helping him once apraxia was diagnosed. Occupational therapy was also necessary.

His intensive speech therapy is three to four times a week and includes brushing his tongue with a toothbrush; trying to get him to blow bubbles, blowing through straws, blowing candles out; getting him to pucker his lips, trying to repeat the sounds p, b, m, d, and others, to strengthen and coordinate his facial and mouth muscles. The therapist recommended massaging his cheeks to tone his muscles.

Adam now says up to 80 words. We don't always understand him because he cannot produce some of the syllables/consonants of speech. When the therapy first began, the only sound that he could say was "mmmm."

A few months ago, our family had a frightening experience when Adam got lost while we were on an outing at a large zoo. It taught us an important lesson. I have since gotten an ID bracelet for Adam, since he cannot speak his name or give a phone number or ask for help himself.

Apraxia of speech is an often overlooked disorder with no known cause. In defining developmental apraxia of speech, the American Speech-Language-Hearing Association (ASHA), describes its effect as: "The child knows what he or she wants to say, but the brain is not sending the correct instructions to move the body parts of speech the way they need to be moved."

Adam is now 6 years old and attends a special education kindergarten class for speech. He writes his name and uses a special computer device to help him communicate. His speech is slowly getting better. Sometimes it is very fast and gets garbled.

As a parent, I cannot stress how important it is to educate medical professionals, teachers and parents about apraxia. When Adam was diagnosed with apraxia I didn't know where to turn for help. If more professionals knew about this disorder, many more parents of diagnosed or undiagnosed children would know there is hope and information that can help them.

Many parents whose children don't talk by age 2 or 3 may not think there is a problem. I was reminded of that by relatives. They counseled, "The child will talk when he is ready, don't worry." If the child isn't diagnosed and doesn't have intensive therapy early, valuable time may be lost and the speech patterns can be very hard to correct. As the child gets older, other problems can arise.

Gaining strength from support

How did I learn more about apraxia? A relative sent me a newspaper article about apraxia and a support group here in New Jersey, the C.H.E.R.A.B. Foundation, headed by Lisa Geng. Lisa had also founded the Children's Apraxia Network since her son, Tanner, had been diag-

continued on page 43

C.H.E.R.A.B. Foundation

C.H.E.R.A.B. (Communication Help, Education, Research, Apraxia Base) Foundation is a nonprofit organization whose goal is to improve the health and welfare of all children with speech delays and disorders, with a special focus on apraxia or other severe neurologically based speech conditions. The group describes the "cornerstone" of their efforts as bringing "professionals from different disciplines together to provide the most comprehensive evaluations and treatments for these children."

The Foundation, with the help of the Consortium for Fatty Acids, Omega-3 Research Institute, Inc., held the first conference for therapy of verbal apraxia/dyspraxia, "Verbal Apraxia/Dyspraxia and Essential Fatty Acid (EFA) Supplementation: A New Potential Therapeutic Intervention" in July 2001. According to Lisa Geng, president and founder of C.H.E.R.A.B., "We are currently exploring working with one of the leading teaching/research hospitals here in New Jersey, which has shown an interest in coordinating clinical trials involving the use of essential fatty acids (particularly omega 3 and 6) in children with severe multi-faceted speech/communication disorders." Says Geng, "We are all very excited about the tremendous potential this research would hold for our children's future to help bring them a voice."

Evan's Story

by Stacey Abenstein

The question that everyone seems to ask me is, "How did I know there was a problem at such a young age?" My son Evan is our second child. As an infant, he babbled normally. When Evan didn't have any words by his first birthday, we didn't panic. We tried not to compare him to our first child, Carly, who seemed to be born talking and has always been very advanced. When Evan started saying a few words at 15 months, we were thrilled. Those words had simply vanished at 18 months! People tried to tell us that boys talked later, and that Einstein didn't talk until he was 5. I knew in my gut that there was something wrong.

A very dear friend who is also a neurodevelopmental pediatrician sat down with Evan at a barbeque, and determined that Evan had a severe delay in expressive language, but at 20 months, was at or above age level in ALL other aspects. He handed me the number for Early Intervention, and the quest for answers began.

Early Intervention evaluated Evan at 21 months and determined that his expressive language was at a 15-month level. We started speech therapy at 22 months. The therapist started with the "withholding" approach. We would model the word "pretzel" and Evan would have to repeat the word to get the pretzel. Evan got so frustrated he kicked me in the shins! He could not imitate a hand motion, let alone a sound. After a week or so of this, the speech therapist realized a different approach was needed. She suggested that Evan had apraxia of speech. I made her spell it, and I hit the Internet before she

Evan loves his sister.

continued on page 42

Evan's Story Continued

pulled out of the driveway. After all the research I did, all I could do was cry!

I followed up the therapist's diagnosis with a hearing test and a trip to another neurodevelopmental pediatrician that my friend had recommended. Apraxia of speech was confirmed. And so started our journey to remediation.

We upped the EI speech therapy to twice a week and had an occupational therapist evaluate Evan next. We discovered that Evan had sensory integration dysfunction. Just an added bonus! I read on the Apraxia-Kids LISTSERV that it is common for this combination to be present. With the occupational therapy in place, we trudged on. Evan was asked to leave his preschool at 26 months. He had been hitting or, as I called it, "communicating with his hands." We replaced preschool with gymnastics and swimming, as the gross motor activities produced the sensory input Evan needed. The hitting continued, but we could never predict when it would happen.

When he was 30 months old we felt that Evan needed more. We added a session of private speech therapy and temporarily replaced OT with a group speech/OT session given in a preschool environment. Evan's speech exploded! He went from 40 to 100 words/approximations in about a month! He also started to combine two words, which requires more motor-planning than he had ever been able to accomplish!

We have him attending twice a week a very small, home-based toddler program, with normally developing children, that he absolutely loves! He doesn't seem to be any more aggressive than any other 2-year-old boy in this setting. We had determined that his aggressive behavior gets worse as the number of children increases, so we were careful to select a program that was small enough to meet his needs.

It has been a very tough year! There were times that I felt like a shut-in, never leaving the house in fear that Evan would hit other kids in frustration. There were times that I felt that the hitting must be due to bad parenting. Although I know in my heart we are doing everything we can for Evan, I can't help but blame myself for not always having as much patience as I should. And what about the future? The prospects of further learning disabilities, as stated by the experts' statistics, scare me to death. We will just have to take it one day at a time.

While looking for more information and support, I stumbled upon the Children's Apraxia Network. My EI SLP came with me to my first meeting. While I am generally not a group kind of person, I found the information disseminated invaluable. I also felt a kinship with the people attending the meetings, as no one else I knew had a child with apraxia. I have since agreed to become the group's secretary and have been known to be seen taking the minutes in crayon!

While my original objective for becoming part of the group was totally selfish, the roller coaster ride has brought me to a point of wanting to help other parents in line for the ride.

Update

Now 4, Evan is doing extremely well. He identifies all the uppercase letters and most of the lowercase as well. He knows his address and phone number. He writes his name better than most kindergartners. He spent last summer at regular day camp, three full days per week. It was a huge self-esteem builder for Evan and his connected speech improved as well. He is still difficult to understand at times, but he can usually get his point across.

He attends two preschool programs—Pride, the district's preschool special program, as well as a regular preschool—and is succeeding in both. At school, Evan also receives individual speech therapy twice a week and group therapy once a week. To address his sensory integration needs, he receives one individual occupational therapy session and a sensory motor group.

He will attend camp once again this summer, this time with his sister. He will be fine, in fact, he will have an even better time, as the camp has even more to offer than last year's camp. But I will probably worry all summer! EP

Worst Nightmare Continued

nosed with apraxia. After talking to Lisa, attending the Foundation's meeting and feeling inspired by the help I received through The Compassionate Friends, I decided to start a support group in my area.

Though we are without Danny, my family lives on with Adam and Josh, who is almost 3. I hope someday Adam and Josh will ask about their brother. Josh is speech delayed and has been diagnosed with pervasive developmental delay (PDD) with autistic tendencies. The comfort and help that we get from our support group is extremely beneficial to us and also encourages us to help others. **EP**

Jeanne Buesser is the President/Founder of the Apraxia Network of Bergen County, NJ (Web site: http://community.nj.com/cc/apraxianetworkofbergencounty).

Tips from Jeanne for starting a support group

- Find a public place to meet.
- Write a press release—who, what, where, when and why—to help promote your group, to be placed in as many local papers as possible.
- Find relevant articles for eventual distribution to other parents.
- Start a Web page, if possible.
- Maintain a contact list with names, phone numbers, addresses and e-mail.

This month, EP is honored to introduce its readers to Dr. Jan Blacher who will contribute a regular column on research in the area of family and disability: *Research Reflections*. Dr. Blacher received her AB from Brown University, and her PhD from the University of North Carolina at Chapel Hill. She has been a Professor in the School of Education at the University of California, Riverside, since 1979, where she teaches a course on exceptional children required of teachers in California; she also teaches and trains masters and PhD students in research on exceptionality. Dr. Blacher's own research has had a parent/family focus for the last 25 years. She is principal investigator of the UC Riverside Families Project, a study of families of children with severe disabilities that has been ongoing since 1982. Over 600 families have been involved in the Families Project research; their participation has contributed to our knowledge about family coping, the cultural context of retardation, dual diagnosis, and the transition to adulthood. Due in part to the encouragement of her own research families, Dr. Blacher has developed *Research Reflections* as a forum for communicating exclusively with parents. The purpose of this column is to provide "news you can use." She is eager to read your reactions to *Research Reflections* and any suggestions you might have. Send email to: jan.blacher@ucr.edu.

CONFESSIONS OF A RESEARCHER: Blind Alleys, Unintended Consequences and Really BIG Mistakes

by Jan Blacher, PhD

I remember a birthday gift that my older brother got when I was in preschool—a really huge Pink Pearl eraser that had the words, "I never make BIG misteaks" printed across it. By the time I was old and schooled enough to get the joke, I had already made plenty of my own.

Before I can comfortably commence as your resident researcher and author of "Research Reflections," I have a few confessions to make. The first is that I wear my heart on my sleeve—you'll always know where I'm coming from. When I was asked to write this column for Exceptional Parent (EP), I was excited. I had been working with and studying parents since graduate school, but the pressure was always "on" to publish in the most scientific (read: esoteric, ivory tower) journals. After 20 + years of this, it is time to communicate with the readers I care most about.

I'll start off confessing one really big mistake—believing everything I read about parents of exceptional children. The literature we were assigned in graduate school evoked images of Edvard Munch's etchings—depressed, sad faces of stressed-out parents and families. In a subsequent column I will review 100 years of this literature on families and disability for you; suffice it to say here that challenges were emphasized over triumphs, negative impact and stress over positive contributions. I was led early on to expect to find great family distress. After almost 20 years of studying large numbers of families who have children/young adults with severe disabilities, I have learned that the best word to describe these parents is resilient. They have withstood the fickle winds of social policy and practice regarding their children (from advice to "place that child into an institution and forget about him," to "all children with disabilities belong with their families," to "young adults with mental retardation should be living and working independently in the community.") And, in addition to dealing with ongoing or newly appearing behavior problems or medical concerns, they have had to contend with the arrogance, stubbornness or insensitivity of service providers and professionals. If that isn't resilience, then what is?

Researchers' dilemmas are not always about really big mistakes, however; sometimes we just find ourselves traveling up a blind alley, as we did in some of our earlier studies of family coping. Since 1982, we have been interested in what factors help parents to keep a child with very severe impairments at home, and what factors influence out-of-home placement. We hypothesized that a lack of "attachment" between parent (mainly mother) and child would increase the likelihood of placement. This was based, in part, on a review that my friend and former mentor, Ed Meyers, and I published in 1983. Furthermore, we hypothesized (based on all that accumulated literature) that once a family placed a child, family members would soon "detach." Detachment (or "out of sight, out of mind") would be evident by lack of visitations and phone calls to the child/caregiver, for example. Our hypotheses apparently seemed reasonable to the federal agency that funded the project. It turned out that not only did mothers express and exhibit strong attachment to their children (behaviorally and as reported on questionnaires or in interviews), but also that this attachment was a primary reason that families did not place sooner. In no case did a family place because of lack of attachment.

In order to study "detachment," we embarked on a series of studies of families who had recently placed their son or daughter. These studies included several hundred families whose children were in residential facilities in California, Arizona, Massachusetts, or Florida. In one study, Bruce Baker, Kristin Feinfield and I interviewed 53 families three times, an average of 1, 2, and 3 1/2 years following placement. Parental visitation remained high across these time periods, with 83 percent of families reporting some type of visit at least monthly by the end of 3 1/2 years. Expressed attachment was high and stable, and most parents reported experiencing less guilt than at the time of placement. Parents were still thinking and talking about the child frequently. In additional studies, using other families, we also found little evidence for detachment. Parents' level of involvement with their children right after placement was highly predictive of their involvement 3 1/2 years later. Furthermore, in a series of studies we have discovered that parents' own adjustment post-placement, and their perceived well-being of their family, was very high following placement. In sum, the attachment-detachment theory in this case did lead me down a blind alley, but in its pursuit I arrived with further evidence of parents' resilience.

And then, sometimes to a researcher's dismay, there are unintended consequences. Another aspect of family coping that has been of interest to researchers, practitioners and families alike is "support." As you well know, support for families can take many forms, and trying to assess parents' knowledge of, use of, and satisfaction with support has posed real research challenges. In our studies, we have been concerned most with formal support (services provided by the public schools, regional centers or state agencies, or the federal government) and informal support (mainly from friends or other family members). One clear intention of such support was to increase the well-being of families, reduce stress and, for some, prevent the likelihood of costly out-of-home placement. Ironically, we found that the more formal support (especially respite) that parents of children with severe retardation had, the more likely they were to consider, and eventually follow through with, out-of-home placement. Such unintended consequences were, at first blush, alarming and puzzling to us.

Upon further inspection, the notion that the more supports parents had, the more they wanted seemed reasonable. For one thing, the number and intensity of services were related to the child's behavior; low adaptive skills and high maladaptive behavior became a formula for family support need. However, we found that service providers couldn't understand why, after disseminating the contents of their "little black bag" of social supports, parents requested more and more, and then went on to seek out-of-home placement anyway! We realized that their delivery of all those service "goodies" came too late—after families had made the decision to seek out-of-home placement, after they had shopped around for placements, and after they had decided they couldn't take the stress any more. As researchers, it became our job to inform service agencies that they needed to provide meaningful support to families who have children with severe disabilities and maladaptive behavior as early as possible, before there is so much stress that a family crisis occurs.

As a researcher, I have never found a really big pink eraser to wipe out my mistakes—but being alert to them has taught me much. What I hope for is more opportunity to reflect on findings from the field—both good and bad—and the wisdom to know the difference.

These studies I refer to have been funded by the National Institute on Child Health and Human Development (NICHD) of the National Institute of Health. While each particular grant since 1982 addressed different issues across the lifecycle of families (e.g., parents' perception of schooling; the correlates and consequences of placement; adolescence and lifespan concerns; the transition to adulthood) together they comprise what is known as the University of California, Riverside (UCR) Families Project. The Project began in 1982 with 100 families who had children with severe disabilities, then between the ages of 2 and 9 years. Today, I am still studying the original group of families, plus hundreds of others who became participants during follow-up waves of the study.

EDITOR'S NOTE: A list of the studies offered by Dr. Blacher may be obtained by e-mailing requests to: epedit@aol.com.

How did your family cope with disaster?

Project Cope

Project Cope is a national clearinghouse for resources related to trauma recovery, with an emphasis on special and vulnerable populations, including individuals with disabilities. With the support of the federal Administration on Developmental Disabilities, the Westchester Institute for Human Development developed Project Cope to meet the unique coping needs of children and adults with disabilities in the wake of the September 11th events. This is the third in a series of EP articles about trauma and its effects on children with disabilities and their families.

September 11th and its aftermath

The terrorist attacks of September 11th opened a new chapter in American history. The September 11th attacks began several months of stress and uncertainty. Throughout this, families have remained committed to minimizing the impact of these events on their children.

Our first two coping guides

Last fall, EP featured two articles about disaster and coping. In these articles we advised families on how to cope with trauma. In our first coping guide (November 2001), we outlined some expected reactions in children and provided general suggestions to help children cope. How children cope is closely related to how their families are coping. Thus, our second coping guide (December 2001) focused on parent reactions to trauma.

Taking stock: The Project Cope – EP Family Survey

Following the September 11th attacks, we heard from and worked with many families of children with disabilities. Reactions in those families varied greatly. The parent of a child with severe autism shared her story with us: her child knew little about the events themselves, but old behavior problems reemerged due to the stress the whole family experienced. In another family, Heidi, an eight-year-old girl who uses a walker, told her mother she was afraid she'd 'never get out of her school' building if there were a disaster. Maria, age four, reacted by becoming withdrawn. Cassandra, three, lost her mother on September 11th and will not go to nursery school without her father. Jake, age twelve, became obsessed with details of the disaster and subsequent cleanup. His preoccupation is just now beginning to wane.

Stories shared by these and other families provided information that helped shape our coping guides. Now, we'd like to take stock from a broader perspective. How did children, especially children with disabilities, react to the events of September 11th? We need your help to answer that question. With the support of EP and the Administration on Developmental Disabilities, Project Cope is conducting a national survey, seeking information from families about the impact of these events on children with disabilities. The field of trauma studies is well developed, yet there is little information on how families of children with disabilities might be uniquely affected. The goal of this research is to learn more about children and trauma. Your responses will better our understanding of how to help children, particularly children with disabilities, cope with trauma.

Tell us by participating in the Project Cope—EP Family Survey.

Completing the survey

Please consider responding to this survey (found on pgs. 49-50). Either complete the form on the next page and mail it back–the survey is postage-paid and does not require a stamp–or log on to our web site, http://www.ProjectCope.net. In the first part of the survey we ask about your family and how directly you were affected by the disasters. In the second section we ask you to tell us about your children and how they reacted. We are specifically interested in learning more about children with disabilities, so please answer first about your child or children with disabilities. Then, if there is room, tell us about the reactions your other children had. In the final section, please share any comments or stories that will help us understand how your family reacted to the disaster.

Your participation is voluntary, confidential and anonymous. You must be age 18 or older to participate. Any results we report will be summary in nature and will not include any identifying characteristics. If you are in distress, or if completing the survey is too difficult, please consider seeking help from a mental health professional. Call or e-mail Project Cope and we will be glad to help you locate supports in your area. Look for survey results in a future issue of EP.

This survey was developed by Project Cope of the Westchester Institute for Human Development (WIHD), a University Center for Excellence in Developmental Disabilities, Education, Research and Service. WIHD is located at Westchester Medical Center and NY Medical College in Valhalla, New York. Project Cope is funded through a grant from the Administration on Developmental Disabilities, Administration for Children and Families, US Department of Health and Human Services. The content does not reflect the position or policy of the agency and no official endorsement should be inferred.

This survey was developed by the Directors of Project Cope, Daniel Crimmins and Anne Farrell, with the assistance of Jonathan O'Brien, Jillian Mattessino, Alison Bailey, Suzanne Busby, Monica Feinberg, Dana Leonardi, Elizabeth Diaz and Jeanne Nessebroth. Project Cope materials, including this survey, may be copied and disseminated without specific permission as along as they are reproduced verbatim, credit the authors and include contact information for Project Cope:

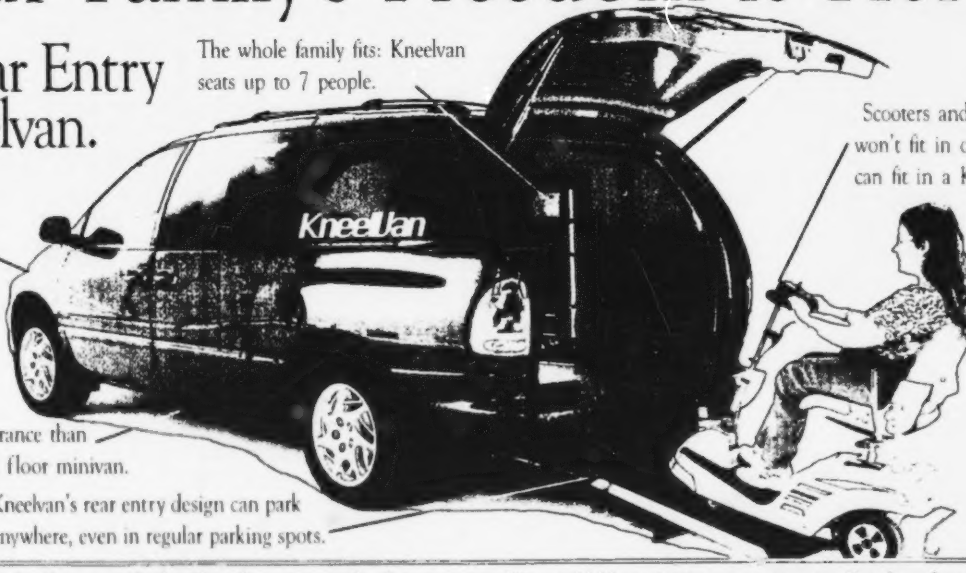
Your Family's Freedom is Here:

The Rear Entry Kneelvan.



The whole family fits: Kneelvan seats up to 7 people.

Scooters and chairs that won't fit in other vans can fit in a Kneelvan.

Kneelvan is the most reliable lowered floor minivan ever.

More ground clearance than any other lowered floor minivan.

Kneelvan's rear entry design can park anywhere, even in regular parking spots.

Designed with your family in mind, the **Kneelvan is simply the easiest way to travel.** Unlike side-entry conversions, we designed the rear entry KneelVan so you can **never get blocked by someone parking next to you**. Kneelvan is perfect for families with kids: its the best family van ever.

We would like to invite you to compare Kneelvan for yourself. Call today for more information and our free video.

THE MELMARK SCHOOL

2600 Wayland Road, Berwyn, PA 19312 ◆ 1-888-MELMARK ◆ Fax (610) 353-4956 ◆ www.melmark.org

Our approved private day and boarding school serves children ages 5-21 who have:

- Autism/Pervasive Developmental Disorders/Asperger Syndrome
- Acquired Brain Injuries
- Cerebral Palsy
- Mental Retardation
- Neurological Disorders

Situated on an 80-acre country campus, Melmark's goal is to maximize independence through "best practices" in Applied Behavior Analysis, functional curriculums, vocational training and collaborative services.

We Offer Your Child:

- Low Student/Teacher Ratios
- Applied Behavior Analysis
- Functional Communication Skills
- Adaptive Physical Education, Aquatics, and Therapeutic Horsemanship
- Physical, Speech and Occupational Therapy
- On-Site Physicians and 24-Hour Nursing
- Psychological and Family Support

To arrange a personal visit, request a brochure or video, contact Peter McGuinness, Director of Admissions, at 1-888-MELMARK Ext. 636 or email admissions@melmark.org

Parent Survey on the impact of September 11th on children

This survey asks about your family's reactions to the terrorist attacks of September 11th. We are most interested in the experiences of children under the age of 18, particularly those with disabilities. If you have more than three children, please complete the survey for your child with a disability and his or her siblings closest in age. This survey is part of a research project; your participation is totally voluntary and completely confidential.

TELL US A LITTLE ABOUT YOUR FAMILY **Today's date** ___ /___ /___

Who lives in your home? Number of parents ________ Number of children _______ Number of other family members _____

Person completing the survey: ☐ Mother ☐ Father ☐ Other Your zip code ____________

How directly was your family affected by the September 11th attacks? ☐ Not at all ☐ A little ☐ Some ☐ A lot

To what degree was your family affected economically by the attacks? ☐ Not at all ☐ A little ☐ Some ☐ A lot

How much were your family routines disrupted in the first week after the attacks? ☐ Not at all ☐ A little ☐ Some ☐ A lot

To what degree has your family life returned to normal? ☐ Not at all ☐ A little ☐ Some ☐ A lot

What were your major sources of support following the attacks? (check all that apply) ☐ family ☐ friends ☐ community ☐ co-workers ☐ faith ☐ mental health professionals ☐ support group ☐ learned about trauma ☐ learned about coping

Did you read our coping guides in EP? ☐ Yes ☐ No—If yes, how helpful were they? ☐ Not at all ☐ A little ☐ Some ☐ A lot

Did you visit the Project Cope web site? ☐ Yes ☐ No—If yes, how helpful was it? ☐ Not at all ☐ A little ☐ Some ☐ A lot

TELL US ABOUT YOUR CHILDREN	**Child 1**	**Child 2**	**Child 3**
How old is this child in years and months?	___ years ___ mos.	___ years ___ mos.	___ years ___ mos.

COPING WITH DISASTER

COMMENTS: Please tell us how your family was affected by the events of September 11th. Share initial reactions and how they changed over time. Include specific changes you observed in yourself and your children, as well as things your children said or did. If you have a child with a disability, do you think these events affected her or him in unique ways? Use additional paper as needed.

☐ Please check this box if we can share your story without revealing any personal details.

FOLD FIRST ALONG THIS LINE

THANK YOU for completing this survey. Please return it to the address below or fax to (914) 493-1973.

The survey may also be completed online at www.projectcope.net.

If you have any questions, please contact us at (914) 493-5202 or by e-mail at projectcope@nymc.edu.

Stress reactions usually decrease within four to six weeks of a traumatic event. For the September 11th attacks, this has been complicated by the extended rescue and recovery period, the anthrax letters, the continuing threat of terrorist acts, and the war in Afghanistan. By this time, most people who were not directly affected by the trauma should be experiencing few reactions. Individuals directly affected may be experiencing an array of reactions. If either you or one of your family members is still having intense reactions, consider consulting a mental health professional. Call or e-mail **Project Cope** if you would like help locating a professional in your area. Our web site (www.projectcope.net) has a great deal of information about the recovery process, as well as what to look for in a therapist (also available in the November and December editions of **Exceptional Parent** magazine). The **Project Cope** website also includes links to many professional and community organizations with disaster-related information.

PARENTS AS TEACHERS
NATIONAL CENTER, INC.

Universal Newborn Screening

In 1961, Dr. Robert Guthrie of the University of Buffalo developed a laboratory test to detect phenylketonuria (PKU) in newborns. PKU is an inherited metabolic disorder resulting from an enzyme deficiency; if left untreated, it results in profound mental retardation. In 1963 Massachusetts became the first state to mandate screening for PKU, which can be treated by lifelong dietary management and counseling. The National Association for Retarded Children (now The ARC), the Children's Bureau and the Kennedy Foundation were foremost among the organizations that pushed for widespread adoption of the Guthrie test, and by 1966 it was required for all children by all 50 states and the District of Columbia.

Dr. Guthrie and other researchers continued to develop newborn screening (NBS) tests to detect many more disorders, and each state decided what screens would be available for its newborns. Significant disparities resulted; in 1997, in Massachusetts, infants were tested for 10 or more disorders, while Utah's babies were screened for three. Montana and South Dakota each mandated three tests and offered one other by special request only. In the same period, with the introduction of ever-smaller and more powerful microprocessors, technology and equipment became significantly more sophisticated. This permitted testing that had not been feasible before. A process called tandem mass spectrometry (tandem MS, MS/MS) can now run tests for nearly 40 disorders at one time. None are curable, but all are treatable.

In the last two years, many states have expanded their NBS programs. Almost all Pennsylvania hospitals now offer the full spectrum of testing, although the law mandates testing for only six. Massachusetts routinely screens for more than 15 disorders and is running a pilot program offering 30+ tests. Wisconsin has almost tripled availability, from 7 tests to 20. Yet universal NBS still engenders much controversy, and there are many issues to be resolved before consensus can be reached on how the US will move forward.

The data tells us that of the four million babies born in the US each year, ten to twelve thousand may have one or more of these detectable...and treatable...disorders

ISSUES: These may be economic, political, professional, sociocultural, religious. Capital spending, training, payment policies, long-term follow-up; insufficient hard financial data; union issues; professional knowledge levels and practice habits; citizen knowledge, and cultural and religious beliefs and practices; insurance, managed care companies, Medicaid, ChIP programs, the uninsured–all these and many more must be part of discussions and resolution.

With the current system, a child born in Louisiana with galactosemia will likely live a life marked by mental retardation and other special health care needs, while similarly affected children born the same day in most of the rest of the country will receive immediate treatment and become productive members of society. The data tell us that of the four million babies born in the US each year, ten to twelve thousand will have one or more of these detectable disorders, an almost-negligible number. The overall cost or benefit to our society, though, will vary wildly from one child to another because of the patchwork of screening availability. We as a nation must find a way to embrace universal NBS and make it routine for all children born in the US. More than that, it is downright wrong not to do so when it has proven its worth time and again!

It is a question of education and awareness. Research shows that the average couple planning to have children does not know anything about existing screening programs, much less the capabilities offered by tandem MS, largely because OB/GYNs, pediatricians, genetic counselors and related professionals are not familiar with universal NBS. The education gap relates to professionals and consumers, rich and poor, people of every race, religion and ethnicity. Few people know much about any of the issues. Worse, among the people who do profess knowledge of NBS and the issues, a good deal of what they "know" is wrong.

Gynecological and Reproductive Services FOR Teenage AND Adult Women WITH Special Needs

Catharine A. Kopac, PhD, GNP

Although I am a student of life-span development, my area of focus since the mid-seventies has been gerontology. Only in the last decade have I become aware that persons with developmental disabilities are such a vulnerable, diverse group. My realization came quite by chance, when a nurse midwife asked me to help her write a clinical article about teenage girls with developmental disabilities who need gynecological and reproductive (Gyn/Rep) care. I agreed to help her and in doing a review of the literature became aware of the paucity of research on this topic. I found that it was nearly impossible to obtain reliable information on the numbers of teens and adult women with special needs. Fortunately, a neighbor and exercise companion, Joni Fritz, was then the Executive Director of the American Network of Community Options and Resources. Her understanding of the field of developmental disabilities, born out of more than twenty years of organizational and advocacy experience, enabled me to frame research questions that could be used to survey the population. Our initial results led to further studies; now we are into our third wave of research on the topic. In this article, I will present an overview of what we learned in our first study and summarize recommendations that we would make to parents, caregivers and health care professionals who support teenagers and women with special needs.

> "Visits go pretty good. He shakes my hand."

In the beginning, my colleague and I had to define what we meant by developmental disabilities. The definition that we have used consistently in our research is: "Developmental disabilities are chronic disabilities affecting people before the age of 22, which are attributed to mental and/or physical impairments and expected to last life-long, and which result in numerous limitations of major life activities." This is a modification and abbreviation of the definition in the Developmental Disabilities Assistance and Bill of Rights Act (P.L. 104-183), Title I, Part A, Section 102(8).

Our first study, using a mail-out questionnaire, was directed towards teenage and adult women with special needs and the agencies that serve them; 127 women with special needs and 155 professionals, representing a similar number of agencies, responded. It is important to remember that the data collected represent responses from a group of women with special needs and the agencies that voluntarily completed and returned questionnaires. We are very much aware that among vulnerable populations, those with the greatest need tend to be those who speak up the least or have "no voice." Nevertheless, the results clearly reveal issues that need attention.

> "Well I wouldn't have a Pap smear until we compromised. [Agency name] said what if we went to a female doctor and I said OK."

Barriers to care

A number of barriers prevented women in the study from receiving Gyn/Rep care. Very often the barrier was financial: difficulty in finding a provider who accepts Medicare and Medicaid; lack of health insurance for some women who work; and unavailability of adequate insurance coverage. One-fifth of the agencies reported having difficulty accessing Gyn/Rep services for the people they support. If the agencies are having problems, then women and/or their families who try to secure care by themselves must face even greater difficulties.

For the women as a whole, problems in securing care were related to comfort; there was no staff member present to assist the patient and help establish ease with the health care provider. In addition, more than 16 percent of the women said fear was an impediment to seeking care; the majority "did not like" the pelvic examination; and one third "did not like" mammograms. More than half the women said they preferred a female physician. The majority of the women did report that their own physician and/or nurse provided time for them and answered their questions. We asked the repondents to "tell us in a few words about these visits to the doctor or nurse;" their comments were very revealing (see them highlighted throughout this article).

Agencies also reported barriers created by family perceptions of sexuality of the teenage and adult women they supported. They ranged from the denial of the need for regular gynecological care to a perception that persons with special needs were "asexual" and had no need for information regarding management of sexual and reproductive health. To complicate matters, 11 percent of the agencies reported that the teenage and adult women they supported were uncooperative during examinations, and five agencies reported that some women had to be sedated prior to examinations. Nearly eight percent of the agencies reported that, even when reimbursement was not an issue, it was difficult to find professionals who were willing to provide services. Despite these problems, more than half the agencies reported that all the women they supported received some gynecologic services, generally the yearly pelvic examination.

> "My doctor's a woman and I relate to her…I feel like she's a friend and that I can talk to her about anything…she sets and listens without rushing."

The study results clearly demonstrated that the bulk of care-giving for and advice-giving about gynecologic concerns was provided by direct support staff or registered nurses. Other findings indicate that, in addition, the survey participants were likely to seek out a staff member or a registered nurse before consulting a physician. This suggests that staff support is key to accessing health care services for many teenage and adult women with special needs.

Services Provided

Only about a quarter of the responding agencies reported that health education was available to all of the teenage and adult women they supported; about half of these provided health education on-site. This percentage seems very low when one considers that these agencies exist to empower the people they serve and to assist them in becoming more self-dependent. It was significant that some of the women respondents expressed a desire to receive more health education.

> "I'm pleased that staff from my home [in Michigan] let me keep my doctor in Indiana. Staff transport me. Sometimes my sister."

A surprising finding was that so many agencies (55.4 percent) did not provide treatment and counseling for sexually transmitted diseases (STDs) and many agencies did not provide STD screening (40.6 percent). While some of the reporting agencies may have referred people to another agency for these services, this number is still alarmingly high; and no respondents reported that their agency referred women elsewhere for these services. Professionals in the field have long recognized that persons with special needs are often perceived as being asexual or sexually inactive. Such attitudes, when coupled with the challenge of providing health education to people whose developmental disabilities include mental retardation, pose unique challenges for the delivery of care. When the lack of STD services is combined with insufficient health education, one suspects that protection against the spread of human immunodeficiency virus (HIV) infections and other STDs may be highly inadequate.

While many of the women did not acknowledge the use of, or rate their satisfaction with, birth control, pregnancy care, STD screening or STD treatment, a significant correlation cluster did emerge. This cluster indicated that many of the women who were sexually active were likely to use services necessary for responsible sexual behavior.

Recommendations

This article has addressed a number of findings. The recommendations that flow from these findings are many. The major ones are summarized here:

◆ Monitor reimbursement strategies and rates for gynecological and reproductive care for teenage and adult women with special needs. Reimbursement for these services must be adequate. Reimbursement must be provided for "well-woman" care (Pap smears, mammograms, STD screening).

◆ Provide gynecological and reproductive care as a separate "arm" of services. Services should be clustered to facilitate easy access for persons with special needs. Appointments should be made at special times (beginning or end of day) to facilitate easy access to offices and allow adequate time for women with special needs. Office staff may need guidance on how to serve teenage and adult women with special needs.

◆ Recognize staff support as key to secur-

continued from page 55

ing services for teenage and adult women. It is essential in reassuring patients, promoting individualized care and enabling primary care providers to deliver quality care.

◆ Recognize that comfort with the care provider is central to service delivery. Providers need education to gain an understanding of the nuances and skills needed to provide safe, quality care to this population.

◆ Acknowledge that health education is a major component of comprehensive, coordinated, safe gynecological and reproductive care. It must be directed to teenage and adult women with special needs, parents and caregivers. Tailored materials, classes and approaches are necessary.

◆ Offer STD screening, counseling and treatment to teenage and adult women with special needs. Education is essential for persons with special needs, their family members and their direct support professionals to understand prevention, detection and treatment of sexually transmitted diseases, and to reduce the potential for sexual abuse.

> "Previously, many ob-gyns reluctant to do exam—fearful I would have seizure during exam."

Conclusion

This study showed that the provision of gynecological and reproductive care for teenage and adult women with special needs has much room for improvement. As with most health care services that are delivered to vulnerable populations, there is a need for consumers and professionals to assume a vigilant, assertive posture to obtain and provide this care. It is the combined efforts of the teenage and adult women themselves, their families, support staff and health care providers in addressing the challenges of teenage and adult women with special needs that will be effective in improving the availability and accessibility of these services. **EP**

Catharine A. Kopac is currently a primary care research fellow in the Center for Clinical Bioethics at Georgetown University Medical Center in Washington, D.C. At present, she has a research and practice interest in three vulnerable populations: persons with Alzheimer's disease, older adults requiring long-term care and women with developmental disabilities.

The Relationship Between Oral Health and Genetic Disorders, Part II

DEVELOPMENTAL ANOMALIES OF THE ORAL CAVITY

It is estimated that about 25% of Mendelian disorders have craniofacial manifestations. The great majority of chromosomal disorders and several environmental disorders affect the oral cavity. In this paper we will describe isolated, as well as associated, oral anomalies and/or traits.

ISOLATED ORAL ANOMALIES

Anomalies of Tooth Number

Missing Teeth This trait is known as hypodontia, the congenital absence of one or more teeth. The term anodontia should be reserved for the total absence of primary and secondary teeth, and modifications of anodontia (i.e., partial anodontia, pseudoanodontia) should not be used at all.

Hypodontia is a rather common characteristic of contemporary men; the incidence ranges from 2% to 6%, excluding third molars, and higher incidences have occasionally been reported. The incidence varies among populations. Family studies have shown absence of the upper lateral incisor is controlled by one autosomal dominant gene with high transmittal occurance and variable expression. It may occur unilaterally or bilaterally, and nine combinations of peg-shaped, absent, and normal incisors have been described.

Absence of the third molar is common and is thought to be controlled by polygenes. It has been reported as both autosomal dominant and autosomal recessive. Although the trait has been known for more than a century, no conclusive data are available. Certain patterns of missing teeth have lately been described as single gene disorders.

Supernumerary Teeth The presence of supernumerary teeth is known as hyperdontia, which is observed less frequently than hypodontia. In most cases, supernumerary teeth are not visible; roentgenograms are necessary to document the presence of impacted supernumerary teeth. Supernumerary teeth vary in morphology. Although they may have characteristics similar to normal teeth, a great number of them are abnormally shaped. Supernumerary teeth are common in the maxillary anterior area (mesiodens) and the maxillary molar area (distomolars or fourth molars). Some cases of supernumerary teeth have been shown to be compatible with genetic transmission.

Anomalies of Tooth Structure

Two main categories of defects affecting enamel and dentin have been described: defects caused by environmental factors during the development of teeth and defects caused by genetic factors.

Environmental Defects

Tetracycline Stain Drugs such as tetracycline are well known as agents that produce discoloration of the teeth. Generally, the color ranges from yellow to slightly brown or blue. The teeth affected are those that were mineralizing while the drug was used. Tetracycline is incorporated with calcium and may be observed in dentin or enamel, which are tooth structures. A clinical history of treatment with tetracycline and fluorescent teeth (yellow fluorescence) under ultraviolet light are criteria in making the diagnosis.

Fluorosis Fluoride ingested with drinking water may produce fluorosis, changes in the enamel. Fluorosis ranges from a few white flecks to brown stains. When fluorosis is severe, the surfaces of teeth appear eroded. The brown color results from hypoplastic enamel and is observed mainly in areas where the fluoride

continued on page 58

continued from page 57

concentration in drinking water is higher than 2 ppm.

Vitamin Deficiencies Nutritional deficiencies may also account for structural defects of teeth. Vitamin D deficiency causes rickets and dental changes that may be manifested as large pulp chambers with high pulp horns, enamel hypoplasia, and microexposures of pulp horns that result in abscesses. In vitamin A deficiency, although enamel hypoplasia is not seen clinically, there is histological alteration of enamel and dentin. Enamel hypoplasia has also been reported in vitamin D hypervitaminosis.

Trauma Trauma during tooth development may cause severe enamel hypoplasia or dilaceration of the teeth. Intrusion of the primary teeth into developing permanent teeth is a common cause of such defects.

Virus Infections in early pregnancy caused by viruses such as rubella may produce dental defects such as hypodontia and enamel hypoplasia of the primary teeth. However, the evidence is not conclusive.

Inherited Enamel Defects (amelogenesis imperfecta)

This group of well-established disorders has been divided into three main types: hypoplastic, hypocalcified, and hypomature. The criteria for classification are the clinical, roentgenographic, and histological features of the enamel.

Hypoplastic Amelogenesis Imperfecta Several types of hypoplastic amelogenesis imperfecta have been described. The enamel may be smooth, pitted, rough or locally rough (all autosomal dominant), or it may have alternating vertical bands of normal and abnormal enamel (X-linked dominant). Lack of interproximal contact because of lack of normal depth of the enamel layer is frequently observed in the smooth and rough types of hypoplastic amelogenesis imperfecta. The enamel may vary from yellowish to brownish, and generally both primary and permanent teeth are affected.

Hypocalcified Amelogenesis Imperfecta This is the most common type of amelogenesis imperfecta. The enamel may be stained by exogenous agents and tends to be brown or black. In hypocalcified amelogenesis imperfecta, the enamel surface is pitted and chips off, thereby exposing the dentin. The teeth are sensitive to changes in temperature. Roentgenographically, the enamel is of normal thickness but has a moth-eaten appearance. The mode of inheritance is autosomal dominant.

Hypomature Amelogenesis Imperfecta Several types of hypomature amelogenesis imperfecta have been described. Generally, discoloration of the enamel ranges from white to yellow-brown. A dental explorer may penetrate the surface of the enamel in the X-linked recessive type. In the autosomal recessive type, the enamel tends to chip away. Enamel cannot be distinguished from dentin on the roentgenogram.

Inherited Dentin Defects

Dentinogenesis Imperfecta Synonyms such as hereditary opalescent dentin have been used to describe opalescent brown teeth as a heritable, isolated defect.

An increasing number of oral anomalies of the hard and soft tissues are being recognized as associated with multiple-system disorders.

Dentinogenesis imperfecta is manifested as discoloration (brown to blue) of teeth that wear down easily just through chewing. The crowns of teeth, especially the bicuspids and molars, are bulbous in appearance, with a constriction at the junction of enamel and cementum. Roentgenographically, the bulbous appearance and constriction at the cervix are more evident, and obliteration of pulp chambers and the root canals can be seen. The roots have also been described as short. The roentgenographic findings mentioned are typical of dentinogenesis imperfecta and of opalescent dentin-enamel teeth associated with osteogenesis imperfecta.

In dentinogenesis imperfecta, the enamel chips off easily, apparently because of a lack of physical retention at the dentin-enamel junction. The exposed dentin is susceptible to attrition. In some cases the crowns of the teeth are worn away and opalescent brown roots with obliterated root canals are observed.

Preventive treatment should include steel crowns on primary molars to avoid attrition and loss of vertical dimension. In permanent teeth, full dentures over crowned teeth have been shown to be successful. Full crowns over teeth with dentinogenesis imperfecta have not been fully accepted because of fear of fractures at the level of the pronounced constriction, but cases have been reported in which such treatment is successful.

Dentin Dysplasia Other dentin anomalies include dentin dysplasia with its variants. Type I is recognized roentgenographically as agenesis of the roots, while pulp obliteration in primary teeth, thistle-tube pulp and numerous pulp stones in permanent teeth are characteristic of type II. Both defects are inherited as autosomal dominant traits, and teeth in both dentitions are affected.

Anomalies Of Bone

Torus Palatinus A hard bony structure generally located in the posterior midline of the hard palate is known as torus palatinus. This bony exostosis is a benign tumor that may show a domelike form or may be lobulated. Occasionally it is present as a spindle running anteroposteriorly at the midline of the palate. Generally it is observed in adults and adolescents, but personal observations have been made at earlier stages. Torus palatinus should be surgically removed in patients with speech impairment and when the patient is a candidate for upper dentures.

Torus Mandibularis An exostosis on the lingual surface of the mandible, generally near the site of the canines, is known as torus mandibularis. This exostosis may be single or multiple, is usually bilateral and, like the torus palatinus, is a benign tumor. Surgical excision is the treatment of choice if the torus interferes with speech or dentures. Torus mandibularis has been reported to be autosomal dominant.

ORAL ANOMALIES ASSOCIATED WITH GENETIC DISORDERS

An increasing number of oral anomalies of the hard and soft tissues are being recognized as associated with multiple-system disorders. In several cases, the oral findings represent manifestations of the syndrome: in other cases, the oral findings are coincidental. Several syndromes are described below in which the oral findings are a recognized manifestation of the syndrome.

Anomalies of Tooth Number Associated with Genetic Syndromes

Congenitally missing teeth and supernumerary teeth have been shown to be associated with several inherited syndromes. Congenitally missing teeth are seen in Witkop syndrome, Böök syndrome, hypohidrotic ectodermal dysplasia, incontinentia pigmenti, Ellis-van Creveld syndrome, Hallermann-Streiff syndrome, focal dermal hypoplasia, lipoid proteinosis, Rieger syndrome, otodental dysplasia, Coffin-Lowry syndrome, trichodental syndrome and others. Supernumerary teeth have been documented in cleiodocranial dysplasia and Gardner syndrome. A few of these will be discussed as examples of the nature of abnormal numbers of teeth in syndromes.

Hypohidrotic Ectodermal Dysplasia, X-Linked Recessive This is the most common type of ectodermal dysplasia; males are severely affected while females are carriers and very mildly affected. The disorder is characterized by sparse thin hair, multiple congenitally missing teeth, abnormal conically shaped teeth, lack of sweat pores and nail abnormalities. In these patients, both dentitions are affected; teeth, when present, are abnormal in shape and smaller in size. On occasion, patients may be completely edentulous. In regions where teeth are missing the alveolar ridges are poorly developed or even flat.

Dental treatment may require construction of dentures that are well tolerated, even for children at four years of age. Dental implants are an excellent alternative for older children and there are now several centers that utilize this procedure. A good resource of information is the National Foundation for Ectodermal Dysplasia (http://www.nfed.org).

Witkop Syndrome or Tooth and Nail Syndrome This syndrome is characterized by multiple congenitally missing teeth, conical deciduous and permanent teeth and dysplastic nails. At birth, nails are very small or nonexistent. Later, they may remain smaller than normal; some, particularly the thumbnail and the nail of the big toe, may have a flat or depressed center with the appearance of a spoon-shaped nail.

This condition will not affect the sweat pores or the hair, and it is an autosomal dominant trait. Because this condition is relatively benign, people are treated only for the correction of their teeth and little attention is given to the nail abnormalities.

Incontinentia Pigmenti This disorder is a genodermatosis characterized by a pigmentary change of the skin resulting in hyper-pigmented tattooing of the skin. In addition, people with the disorder may show a variety of malformations of the hair, eyes, teeth, skeleton, and central nervous system. They may also have developmental delays. Dystrophy of the nails occurs infrequently and is usually mild. Possible teeth abnormalities include congenitally missing teeth, conically shaped teeth, and small teeth (microdontia). Skin changes may disappear with age, and mothers of children with incontinentia pigmenti should be examined for orodental findings that may be the only clinical evidence that they have the disorder.

Incontinentia pigmenti is inherited as an X-linked dominant disorder and in males is usually lethal prenatally. A good source of information is the Incontinentia Pigmenti International Foundation at http://imgen.bcm.tmc.edu/IPIF.

Coffin-Lowry Syndrome This syndrome includes mental retardation, faciodigital anomalies, skeletal abnormalities and orodental abnormalities. The facies is characterized by progressive coarsening of the facial features, along with hypertelorism, antimongoloid slanting of the palpebral fissures, prominent supraorbital ridges, short and anteverted nares, open mouth (in males), pouty lower lip, thick bulging chin, and protuberant ears. It may be confused with that seen in the mucopolysaccharidoses, Williams syndrome, Down syndrome, or acromegaly in adolescents. Skeletal findings include marked scoliosis, pectus excavatum, hyperextensible hands and flat feet. The hands are pudgy, with distally tapering fingers. Orodental findings in Coffin-Lowry syndrome include malocclusion, midline furrow of the tongue and hypodontia. The syndrome is thought to be X-linked or sex-influenced autosomal dominant.

Rieger Syndrome Rieger syndrome is the autosomal dominant association of goniodysgenesis (abnormal development of the anterior chamber of the eye), congenitally missing teeth, and failure of involution of the periumbilical skin (prominent belly button). Goniodysgenesis in Rieger syndrome is manifested primarily as a prominent Schwalbe line, hypoplasia of the iris stroma, and iridocorneal synechiae. Glaucoma, cataract, and microcornea may be associated with the goniodysgenesis. The upper anterior teeth are those absent most frequently. The mandibular incisors are often conical in shape or absent and one or more of the premolars may be absent.

Cleidocranial Dysplasia Cleidocranial dysplasia is characterized by lack of normal development or absence of the clavicle bone, late ossification of cranial sutures, frontal and parietal bossing, shortness of stature and orodental abnormalities. The syndrome is autosomal dominant. Delayed eruption of teeth or lack of teeth have been described; the teeth are actually impacted, and their presence is revealed by radiographs. Supernumerary teeth are one of the most peculiar characteristics of the syndrome. Their shape is similar to that of bicuspids.

Tooth Morphology Alterations Associated with Genetic Syndromes

Otodental Dysplasia Otodental dysplasia is an ectodermal dysplasia characterized by sensorineural deafness and large,

continued on page 60

continued from page 59

bulbous teeth. The age of onset and progression of deafness vary. Some affected individuals may even reach middle adult life without a hearing impairment.

The crowns of molars in affected individuals are larger than average, bulbous, and lack normal cusp and sulcus occlusal patterns. The premolars are frequently smaller than average or absent altogether. In some families only the deciduous canines are affected, while in others both the deciduous and permanent canines are involved, becoming large and bulbous. Pulp stones may be seen on radiographs of affected teeth. The pulp chambers appear to be duplicated, and taurodontism (long pulp chambers and short roots) may be present. Otodental dysplasia is inherited as an autosomal dominant trait with high transmittal occurence and variable expression of the associated defects.

In males the enamel is hypoplastic and thin. The roots of affected teeth are generally more tapered than normal, and the apex remains open longer than usual.

Morquio Syndrome This syndrome is also called mucopolysaccharidosis IV. Its manifestations are platyspondylisis, corneal opacities, keratosulfate excretion in urine and characteristic dental abnormalities. The skeletal changes include progressive spinal deformity, short neck, pectus carinatum, and marked growth failure. In a study of 12 patients with the condition, the anterior teeth were noted to be widely spaced and flared. The posterior teeth were tapered and had pointed cusp tips. The enamel was normal in hardness, but some had pitted surfaces. The hard palate was broad and flat, and dental radiographs showed hypoplastic enamel. The dental findings are unique among genetic mucopolysaccharidoses and are a good adjunct for clinical diagnosis. The syndrome is autosomal recessive.

Ellis-van Creveld Syndrome This syndrome shows hypodontia and alteration of crown morphology. The morphology of the remaining teeth, especially the anterior teeth, is characterized by conically-shaped lateral incisors or cuspids and barrel-shaped central incisors. The lateral margins of lingual surfaces of these teeth appear enlarged, and a high and prominent cingulum is common. Other dental findings include neonatal teeth, serrated alveolar ridge, supernumerary frenula and pseudo cleft lip resulting from a hyperplastic midline frenum.

Taurodontism In taurodontism the pulp chambers are enlarged in an apical direction and the bifurcation or trifurcation point of the molars is also displaced toward the apex. As a result, the tooth has the shape of a block with small divergent roots. Because the crown is not affected, taurodontism is essentially a radiographic finding. There are several syndromes associated with this unusual trait; this clinical sign may be helpful in the characterization of a given disorder. Syndromes with taurodontism include:

- Klinefelter syndrome, or 47 XXY, and also in individuals with an extra X chromosome such as XXXY or in those with XY:XXYY mosaicism;
- Trichodento-osseous syndrome;
- Mohr syndrome, or orofaciadigital syndrome type II;
- Hajdu-Cheney syndrome;
- Taurodontism, microdontia, dens invaginatus;
- Stoy syndrome (taurodontism, hypodontia, sparse hair);
- Ackerman syndrome (taurodontism, pyramidal and fused molar roots, juvenile glaucoma, unusual morphology of the upper lip).

Anomalies of Tooth Structure Associated with Genetic Syndromes

Trichodento-Osseous Syndrome The trichodento-osseous syndrome is potentially another ectodermal dysplasia, but the reported increase in bone density may remove it from the strict definition of ectodermal dysplasia. It is an autosomal dominant syndrome of excessively curly hair, enamel dysplasia, and radiodense bones. Affected individuals have tightly curled hair at birth; the hair may remain curly throughout life or may become straighter with age. The teeth are affected by enamel dysplasia that has been reported to involve hypoplasia, hypocalcification and, less commonly, hypomaturation. Other dental findings include increased dental caries and delayed dental eruption. Individual teeth can be affected by more than one type of dysplasia, most commonly a combination of hypoplasia and hypocalcification. Taurodontism is present in the trichodento-osseus syndrome, as is a higher-than-expected occurrence of impacted teeth. The cortices of bones appear excessively dense but normal in thickness on roentgenograms. Some affected individuals may have brittle nails that split longitudinally, but no other defects are consistently associated with the syndrome.

Osteogenesis Imperfecta This disease is characterized by bone fragility, blue scleras, hearing abnormalities and dental abnormalities. These last are clinically similar to those observed in dentinogenesis imperfecta: opalescent teeth with bulbous crowns and obliterated pulp chambers and root canals. A history of bone fragility and hearing impairment helps to differentiate dentinogenesis imperfecta from osteogenesis imperfecta.

A classification of osteogenesis imperfecta has been proposed on the basis of the dental findings associated with osteogenesis imperfecta tarda. This classification includes at least two autosomal dominant types, one in which the teeth are opalescent and one in which the teeth are normal. Because opalescent teeth may be evident at the eruption of first lower central incisors at approximately 6 months of age, the dental signs often precede bone fractures in cases of so-called osteogenesis imperfecta tarda.

Pseudohypoparathyroidism There are two types of pseudohypoparathyroidism; they show similar enamel defects. Both are X-linked traits. The enamel defects vary according to sex, the stage of tooth development, and onset of the biochemical changes associated with pseudohypoparathyroidism. In females the enamel [illegible] teeth is markedly pitted. In males the enamel is hypoplastic and thin. The roots of affected teeth are generally more tapered than normal, and the apex remains open longer than usual. The disorder results from an abnormal response to parathyroid hormone; although the hormone is normal in amount, both hypocalcemia and hyperphosphatemia occur.

Anomalies of the Jaw Associated with Genetic Syndromes

Pyknodysostosis This syndrome is characterized by small stature, bone abnormalities, persistence of the fontanelles, large head with occipital prominence, prominent nose, short fingers caused by hypoplasia of the distal phalanges, and absence of the angle of the mandible. Absence of the angle of the mandible is a constant feature that is virtually pathognomonic. Other dental abnormalities include premature eruption of the teeth and hypodontia. Pyknodysostosis is inherited as an autosomal recessive trait.

Cherubism Cherubism is characterized by symmetric bilateral enlargement of the mandible. The condition may begin as early as 2 years of age. The lesion is hard to the touch, and painless. In some instances, cherubism may affect the maxilla, with involvement of the floor of the orbit. This complication displaces the globe upward and exposes the scleral rims, suggesting a cherubic look. A summary of a report on a 4-year-old male of apparently triracial extraction can be illustrative. There was no history of consanguinity or of a similar condition in his family. The child, who was referred to us with a diagnosis of Noonan syndrome, was short in stature and had a congenital heart defect, bilateral palpebral ptosis, and bilateral enlargement of the mandible in the area of the first and second molars. Roentgenograms revealed characteristic multiloculated radiolucencies in the area of the molars that extended almost to the lower border of the mandible. Several teeth were displaced by lesions.

The natural history of cherubism shows that the lesions of the maxilla and mandible eventually regress. The regression may be noticed during puberty, yet later in life no sequelae of the condition are found. The man described above was monitored into adulthood. Although he has virtually no facial deformation now, he has very poor dentition because of caries and tooth displacement because of bone deformation. Furthermore, the alveolar ridge has a decreased height. In this particular case we found lesions on the ribs that were radiologically and cytologically similar to the lesions of the mandible. Cherubism is autosomal dominant, and many cases display new mutations.

Some oro-dental findings, such as congenitally missing teeth, amelogenesis imperfecta or cleft of the lip and palate, may be isolated defects.

Gardner Syndrome Gardner syndrome is characterized by a triad of alterations that include multiple osteomas, soft tissue lesions such as epidermoid cysts and fibromas of the skin, and multiple polyposis of the large intestines. The most common sites for osteomas in this syndrome are the frontal bone, maxilla, mandibular angle, and lower border of the mandible. Other oro-dental findings include multiple odontomas, supernumerary teeth, and impacted teeth.

Recognition of the osteomas is important because they generally precede the appearance of intestinal polyposis, which has a marked tendency towards malignant degeneration. By 30 years of age about 50% of cases are of malignant degeneration, and the percentage increases with age. Potential colon cancer may warrant prophylactic colon removal in early adult life.

SUMMARY

In this article and Part I (December 2001 issue), we have illustrated the relationship between oral-dental findings and genetic disorders. Some oro-dental findings, such as congenitally missing teeth, amelogenesis imperfecta or cleft of the lip and palate, may be isolated defects. However, there is ample evidence of oral-dental findings that are found as part of a more complex systemic disorder. The clinical relevance of the findings varies; they may only be descriptive, such as a fissured tongue in Down syndrome, but in other cases missing teeth may represent an important finding in the diagnosis of ectodermal dysplasia, X-linked recessive, incontinentia pigmenti or Rieger syndrome. Brownish or opalescent baby teeth may be the first sign of osteogenesis imperfecta, while freckle-like spots on the lips may indicate intestinal polyposis, as in Peutz Jeghers syndrome.

We would like to emphasize that children with special health care needs should be examined by a dentist by the time they are one year old. This will allow the dentist to advise the parents about nutritional aspects, oral hygiene habits, and preventive measures. Furthermore, the dentist will play an important role in the integral approach regarding health care needs of the child, in collaboration with the physician and the parents. Good dental health goes far beyond having good teeth. Let us work together to bring a bright smile to our special children!

Dr. Carlos F. Salinas is Professor and Director of the Division of Craniofacial Genetics, Department of Pediatric Dentistry and Orthodontics, College of Dental Medicine at the Medical University of South Carolina, Charleston, SC.

EP Exceptional Parent LIBRARY

THE SPECIAL NEEDS BOOKSTORE

FOR YOUNG PEOPLE

How Many Days Until Tomorrow?
J. Caroline Janover
Josh, a 12 year old with dyslexia, is spending the summer with his older brother and grandparents on a remote Maine island. This is the story of how he finds adventure and discovers new talents in the sometimes rugged wilderness of Maine.
WB7224FY $11.95

Mama and Daddy Bear's Divorce
Cornelia Maude Apelman ACSW, LCSW
To a young child, divorce need be explained only in the simplest terms. This book emphasizes the precious things in a child's life that stay the same. The message conveyed is that no matter where the parents live, they will always love their child.
AWL2IGN $14.95

Nursery Rhymes from Mother Goose
Told in Signed English
Harry Bornstein and Karen L. Saulnier; Illustrated by Patricia Peters and Linda Tom
More than a dozen favorite rhymes illustrated with full color paintings accompanied by 389 drawings showing verses in Signed English. Designed to help young readers strengthen their language skills
GU108TP $14.95

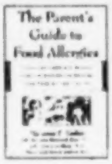
EPILEPSY

Epilepsy: The Facts
Second Edition
Anthony Hopkins and Richard Appleton
This excellent book is designed to present the facts about every aspect of epilepsy in a clear and concise manner. Written by a neurologist, it presents a clear definition of epilepsy, the different types of seizures associated with the disorder, the medical and surgical therapies used, as well as providing practical points on living with epilepsy.
OU5489EP $19.95

Brain Development and Epilepsy
Philip A. Schwartzkroin, Solomon L. Mosh, et al.
This integrated volume applies the emerging concepts in neurobiology to develop an understanding of the origins of the epilepsies of childhood. This practical text covers age specific epilepsies, experimental approaches and therapies, and the integration of such knowledge to help formulate a plan to assist in effective treatment for these often devastating syndromes.
OU8462EP $59.95

Lee, The Rabbit With Epilepsy
Deborah M. Moss
A reassuring tale for young children with epilepsy. The story follows Lee from her first seizure to the doctor's office, and then home with new medication to control her seizure. Ages 4-8
WB182EP $12.95

GENERAL



The Parent's Guide to Food Allergies
Clear and Complete Advice From the Experts On Raising Your Food- Allergic Child
Marianne S. Barber with Maryanne Bartoszek Scott M.D. and Elinor Greenberg, Ph.D.
Whether you are the parent, relative, caregiver, or teacher of a food-allergic child, you know how challenging it is to keep that child safe, healthy, happy, and well fed. The team of authors behind this invaluable book—the mother of a food-allergic child, a board-certified allergist, and a psychologist—will take you through every step of life with a food allergic child. Included issues are: allergy testing-what you need to know; diagnosing and treating anaphylaxis; in-depth discussion of top eight most common food allergies; recipes that are easy, delicious and kid friendly plus much more.
WH5004FA $15.00

The New Language of Toys
Teaching Communication Skills to Children with Special Needs
S. Schwartz, Ph.D. & J.E. Heller Miller, M.Ed.
An updated and expanded how-to guide for using everyday toys to develop communication skills in children with disabilities and make playtime a fun, exciting, and educational experience.
WB1590D $16.95

The Read Aloud Handbook
Jim Trelease
This book makes reading aloud a special pleasure for millions of people. It offers a chance for a new generation of parents, teachers, grandparents, and siblings to discover the rewards and the necessity of reading aloud to children. Not only does the book emphasize the importance of reading aloud, but it also provides valuable time for parents and teachers to spend together with children.
GP9710GN $13.95

DOWN SYNDROME

Gross Motor Skills in Children with Down Syndrome
A Guide for Parents and Professionals
Patricia C. Winders, P.T.
A how-to guide for meeting the challenges Down syndrome presents for gross motor development, coordination of large muscle groups and the sequencing of movements in young children. This book provides guidance for parents of children ages birth through 6 years.
WB171DS $16.95

Babies with Down Syndrome
A New Parents' Guide
Second Edition
Edited by K. Stray-Gundersen
A newly revised complete
and compassionate guide,
written by doctors, nurses, educators, lawyers, and parents.
WB156DS-ENGLISH $15.95
WB178DS-SPANISH $15.95

EARLY INTERVENTION

Early Intervention/Early Childhood Special Education
Recommended Practices
Samuel L. Odom and Mary E. McLean
An elaborate, yet easy to understand, description and supports of the practices that deal with early intervention. Both specific and general practices are discussed by leaders in the field.
PE125EI $39.00

An Activity Based Approach To Early Intervention
Diane Bricker, Kristie Pretti-Frontczak, and Natalya McComas
An ideal text for anyone involved in the fields of early intervention, special education, and child development. It serves as a practical guide in service resources for program administrators, therapists, interventionist, and other members of transdisciplinary teams.
PB3513EI $35.00

GRIEVING

Remembering With Love
Messages of Hope for the First Year of Grieving and Beyond
Elizabeth Levang, PhD. and Sherokee Ilse
An affirming gift for those grieving the loss of a loved one, offering compassion, comfort and guidance with over three hundred short pieces written by those who have been through the greiving process.
FP040DE $11.95

What on Earth Do You Do When Someone Dies
Trevor Romain
A down to earth explanation for children about death. It offers many ways for children to cope with and understand what happens when someone dies.
FS400DE $7.95

Guiding Your Child Through Grief
Mary Ann Enswiler, MA, MRS, and James P. Enswiler, MA, M.Ed
This caring and compassionate guide offers expert advice during the difficult days to help a child grieve the death of a parent or sibling. This book helps readers understand the many secret ways children grieve and offers more insightful information, and advice that can help a child heal.
BO0257GR $13.95

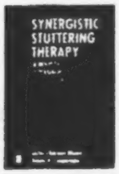
COMMUNICATION

Communication Based Intervention for Problem Behavior
A User's Guide for Producing Positive Change
Edward G. Carr; Len Levin; Gene McConnachie; Jane I Carlson; Duane C. Kemp and Christopher E. Smith
Consolidating years of important research and personal skill, this step by step guide details innovative methods for managing episodes of problem behavior, conducting initial ongoing functional assessments, selecting and teaching forms of communication, and working toward maintenance and generalization. This is an indispensable resource to help individuals with disabilities curtail problem behavior and gain greater independence in the community.
PB1596GN $29.95

YOUR CHILD'S SPEECH AND LANGUAGE **NEW!**
Guidelines for Parents
MARY BROOKS,
DEEDRA ENGMANN-HARTUNG

This charmingly illustrated 52-page book provides information for parents and others who want to know what to expect in the way of speech and language development from infancy through 5 years, and what parents and others can do to help develop normal speech and language.

PB132CM $14.00



SYNERGISTIC STUTTERING THERAPY
A Holistic Approach
SR. CHARLEEN BLOOM AND
DONNA K. COOPERMAN, PH.D.

Learn the details of a program that integrates the principles of speech production with the socioemotional aspects of communication. Discover how to structure individual treatment plans based on attitude, behavior, and interaction within their environment.

BH110CM $40.00

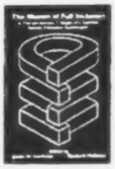
INCLUSION

QUICK GUIDES TO INCLUSION

QUICK GUIDES TO INCLUSION
Ideas for Educating Students with Disabilities
MICHAEL F. GIANGRECO

With brief factual summaries and to the point suggestions, the book is easy to use and focused on the topics most essential to successful inclusion. An entry level guidebook for new teachers and a concise summary of practices for seasoned professionals.

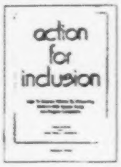
PB143ED $22.95



THE ILLUSION OF FULL INCLUSION
A Comprehensive Critique of a Current Special
JAMES M. KAUFFMAN AND
DANIEL P. HALLAHAN

A collection of analyses by nationally recognized individuals who raise serious questions about the full inclusion of all students with disabilities into general education.

PE178IN $31.00

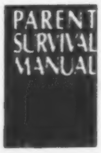


ACTION FOR INCLUSION
How to Improve Schools By Welcoming Children with Special Needs Into Regular Classrooms
O'BRIEN AND FOREST WITH SNOW,
PEARPOINT, AND HASBURY

An extraordinary plain language guide to inclusion. Provides a clear presentation of the values behind full inclusion and outlines a sensible series of actions that can be followed to make full inclusion a reality.

IP700ED $15.00

AUTISM



PARENT SURVIVAL MANUAL
A Guide to Crisis Resolution in Autism and Related Developmental Disorders
EDITED BY E. SCHOPLER

Includes many practical suggestions for dealing with the day-to-day challenges of life with a child who has autism.

PL14900 $39.50

PRESCHOOL EDUCATION PROGRAMS FOR CHILDREN WITH AUTISM
SANDRA L. HARRIS AND JAN S. HANDLEMAN

An especially helpful text for those who are considering creating a classroom to serve these children. It is also a checklist to ensure that the services currently offered are state of the art.

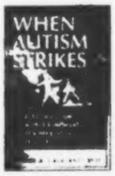
PE145ED $33.00

AUTISM THROUGH THE LIFESPAN

AUTISM THROUGH THE LIFESPAN
The Eden Model
DAVID L. HOLMES, ED.D.

A unique and detailed look at a successful approach to treating and caring for children with autism. Parents, teachers, and treatment professionals will find this book to be informative and insightful reading.

WB176AT $21.95



WHEN AUTISM STRIKES
Families Cope with Childhood Disintegrative Disorder
ROBERT A. CATALANO, M.D

Eight stories of families coping with Autism, or Childhood Disintegrative Disorder offered by parents who wish to lend support and encouragement to others in similar circumstances, as they also cope with daily living while searching for solutions.

PL15100 $19.95

ATTENTION DEFICIT

Unlocking Potential

UNLOCKING POTENTIAL
College and Other Choices for People with LD and AD/HD
JULIANA M. TAYMANS, PHD,

LEGISLATIVE UPDATE

IDEA Reauthorization Update– Input is Welcome

The Office of Special Education and Rehabilitative Services (OSERS) posted a Notice of Request on the Federal Register on January 10, 2002; it asks for public input by February 28, 2002, on the reauthorization of the Individuals with Disabilities Education Act (IDEA). All comments concerning the reauthorization of IDEA should be addressed to Thomas Irvin, OSERS. They can be e-mailed to: Comments@ed.gov. Please include "IDEA Reauthorization" in the subject line. They can also be mailed to: OSERS, 400 Maryland Ave. SW, Room 3086, Mary E. Switzer Building, Washington, DC, 20202-2570. For further information contact: JoLeta Reynolds or Thomas Irvin at: (202) 205-5507; (202) 205-5465 (TDD).

Employment and Training Grant Awarded to Serve Individuals with Disabilities

The Dept. of Labor's Employment and Training Administration awarded approximately $6 million in competitive grant funds for multi-site employment and training projects serving people with disabilities. The program targets projects that result in long-term, unsubsidized employment for people with disabilities.

Grants range between $300,000 and $500,000 for the first year, with a possibility of two additional years of funding. For more information, please visit: http://www.disAbility.gov.

Rare Diseases Act of 2001

The Rare Diseases Act of 2001 was placed on the Senate calendar on December 28, 2001. After its introduction on August 3, 2001 by Senators Edward Kennedy (D-MA) and Orrin Hatch (R-UT), the bill moved through the Senate Health, Education, Labor and Pensions (HELP) Committee quickly. It was approved in mid-October of 2001 and on December 18, 2001 it was passed as amended (S. 1379 RS) by a unanimous voice vote of the HELP committee. Kennedy and Hatch intend to bring the bill to the Senate floor for a vote as soon as possible.

The legislation is intended to further aid the estimated community of 25 million Americans who have a rare disorder. It was introduced along with S. 1341, an act to provide Orphan Drug tax credits that is currently under review in the Senate Finance Committee. S. 1379 is a third wave of the advocacy and reform that began with the 1983 Orphan Drug Act (ODA). The ODA provided 7 years of market exclusivity and expanded tax credits for companies developing and marketing orphan drugs, established an Office of Orphan Product Development at the Food and Drug Administration (FDA), and created the Orphan Products Grant Program. Before its passage, fewer than 10 orphan drugs had been developed between 1973 and 1983. Since passage of the Act, more than 220 new orphan drugs have been approved and more than 800 are currently under development. Since 1983 the ODA has been amended to clarify language and terms, improve efficiency of implementation and, most notably, convene a National Commission on Orphan Diseases to assess activities of public and private agencies.

In 1993, the Office of Rare Diseases (ORD) was formalized under the Office of the Director at the National Institutes of Health (NIH), following the recommendations of the Commission, Congress and patient advocates. In 1995, Senator Mark Hatfield (R-OR) recognized the need to enhance ORD's operations and introduced the Office of Rare Diseases Research Act, a bill that would have formally established the office at NIH. Though the bill passed the Senate, it was not enacted into law.

Without statutory authorization the ORD is often overlooked by the biomedical research community. S. 1379 will fortify the ORD by making it a permanent office at NIH; giving it statutory authority which will allow it to form its own research agenda; doubling its budget to $4 million in Fiscal Year 2002 and "such sums as may be necessary" for each subsequent fiscal year; authorizing new funds for Rare Disease Research Centers of Excellence in the amount of $20 million; and doubling the funding of the Orphan Product Research Grant Program at the FDA–which receives 100 grant applications yearly–to $25 million in FY 2002. The Congressional Budget Office estimates the five-year cost of the Rare Diseases Act to exceed $190 million, but has not quantified improvement in productivity or quality of life from effective drug therapy.

EDITOR'S NOTE:

EP Magazine strongly supports passage of the Rare Diseases Act of 2001. It broadens visibility for the Office of Rare Diseases at the National Institutes of Health and provides funding for research on rare disorders, orphan drugs and other treatments. We urge you to get behind this measure and tell your Senators and your Congressperson why the Act is so important to you and your family (see contact information above). Encourage your family and friends, the professionals who care for your family member with a disability, your colleagues, members of support groups–everyone you know–to speak out.

Approval of Pediatric Exclusivity Bill

On October 18, 2001, the Senate approved by voice vote a bill expanding the 1997 FDA Modernization Act's pediatric exclusivity rule, which was set to expire at the end of 2001. Senators Christopher Dodd (D-CT) and Mike DeWine (R-OH) co-sponsored the Best Pharmaceuticals for Children Act (S. 838); it will grant drug companies conducting clinical research on a drug's efficacy in children a six-month patent extension on that drug. The bill also expands the law to include newborns, establishes an Office of Pediatric Therapeutics at the FDA and sets up a "privately funded foundation" to research other drugs that are commonly used by children. "Kids are not just miniature adults. You can't just cut a pill in half," remarked DeWine (Billings Gazette, 10/19/01). The House passed its version (H.R. 2887) on October 11, by a vote of 41–6.

Bush Announces More than $76 Million for Homeless People with Disabilities

President Bush and Dept. of Housing and Urban Development (HUD) Secretary Mel Martinez have announced more than $1 billion in grants to help provide housing and support services to hundreds of thousands of homeless families and individuals across America. The announcement represents the largest amount of homeless assistance in history. More than $76 million of the grants awarded will go to the renewal of existing Shelter Plus Care projects which help pay rent and provide permanent housing for homeless individuals with disabilities.

National Housing Trust Fund

The Consortium for Citizens with Disabilities and other tenant advocacy groups saw a victory in June of 2001, when Representatives Bernie Sanders (I-VT), John McHugh (R-NY) and Barbara Lee (D-CA) introduced a bill (H.R. 2349) to create a permanent national housing fund. It was referred to the Subcommittee on Housing and Community Affairs on July 20, 2001. If established, this trust fund would create the first permanent trust fund for public housing dedicated to building and preserving rental housing for people with very low incomes, including people with disabilities. The senate version (S. 1248) was introduced by John Kerry (D-MA) on July 25, 2001, and was referred to the committee on Banking, Housing and Urban Affairs. For more information about the bill, or to contact a member of the Senate or the House, visit: http://www.senate.gov or http://www.house.gov

Rethinking Special Education for a New Century

Those who have an interest in special education and its current status in US legislative policy can download a free PDF version of "Rethinking Special Education for a New Century," which is located on the Web site: http://www.edexcellence.net. You can also order a free copy by calling (888) 823-7474. This 14-chapter volume scrutinizes the education now being received by 6 million children with disabilities in the US, and it is published with the participation of the Progressive Policy Institute.

President's Commission on Excellence in Special Education

The Commission on Excellence in Special Education was sworn in on January 15 and set out its agenda for the next four months. President Bush created the commission in October to collect information related to federal, state and local special education programs and to recommend policies for improving the education of students with disabilities. The commission is also charged with producing a final report to the president by this summer that contains findings and recommendations in the nine areas: Cost-effectiveness, Improving Results, Research, Early Intervention, Funding Formulae, Teacher Quality and Student Accountability, Regulations and Red Tape, What Models Work in the States, Federal v. Local Funding. For more information, visit the commission's Web site: http://www.ed.gov/inits/commissionsboards/whspecialeducation/index.html. EP

PEACE OF MIND

When it comes to your child, you don't compromise. Safety is indispensable. You demand quality. Reliability. Functionality.

The Lisa pediatric postural mobility system from Otto Bock gives you all this while maintaining its playful good looks. So go ahead. Take it "off sidewalk". Recline the back rest up to 130°. Accessorize to your heart's content. And enjoy how easily it folds and how little it weighs. You and your family deserve it.

For more information, visit www.ottobockus.com, or call 1-800-328-4058 to find a dealer near you.

SEARCH AND RESPOND INDEX 2001

EXCEPTIONAL PARENT'S "Search and Respond" column affords parents, caregivers, and professionals the opportunity to exchange information about their practical experiences in meeting the everyday challenges of life with a child or adolescent who has a disability. We try to print as many Search and Respond letters as possible in each issue and on our Web site: **http://www.eparent.com**. You can write, fax, or e-mail your letters to: EXCEPTIONAL PARENT Magazine, 65 East Route 4, River Edge, NJ 07661; fax: (201) 489-4111; e-mail: epedit@aol.com; or visit http://www.eparent.com on the Web and click on "Search and Respond," which is located on the homepage. It is important to indicate whether the letter is a "Search" or a "Respond." When sending a "Respond," please indicate the title, initials, month, and year of the "Search" letter you are answering. All "Responds" are forwarded to the writers of the "Search" letters, and most are published. For spacing purposes, all letters may be edited. (As with all matters concerning medical care and advice, individuals are also expected to consult the appropriate professionals regarding care.)

Following is an index of "Searches" and "Responds" from 2001. "Responds" are shown beside the "Searches" to which they refer.

NO
APOLOGIES
FOR
RITALIN

No Apologies For Ritalin ◦ By Vidya Bhushan Gupta, MD ◦ EP8012AD- $19.95

Despite its name, No Apologies for Ritalin is aimed at educating parents of children with ADD by presenting all the treatments available for the disorder.

The first half of the book is a look at what ADD is: the medical aspects, how it is diagnosed, and what causes it. Anecdotes of children diagnosed with the disorder and a discussion of how doctors arrive at their diagnoses begin the book. Issues that parents must deal with, such as understanding and coming to grips with the diagnosis of ADD, whether ADD is a product of bad parenting style, ADD's occurrence with other disorders, and who is most at risk are discussed in this section as well.

Section 2 presents the pros and cons of all treatment options, both conventional and alternative, including non-drug therapies such as psychotherapy and behavior modification. The author, Vidya Bhushan Gupta, MD, MPH, FAAP, writes in his Foreword, "I have discussed the controversy surrounding the use of Ritalin and tried to dispel myths surrounding ADD and Ritalin: 'ADD is not a disease; it is simply a difference of temperament;' 'ADD is due to poor parenting;' 'Ritalin is a mind-altering drug like speed;' 'Don't give Ritalin to your children because they will get hooked on it.'" He explains that his purpose for writing the book is so that "parents of children with ADD will not blame themselves for their child's predicament and will be able to use all the available treatments, including Ritalin, without guilt."

The book offers insights into other issues regarding ADD as well, including: who should treat the disorder and what the goals of that treatment should be; suggestions for parents on dealing with their child's ADD; whether children grow out of their ADD; and how to de-emphasize the negative labels of the disorder by recognizing and building on the strengths of children diagnosed with it.

Patient Persistence

Patient Persistence ◦ By Adele M. Gill ◦ EP8004GN-$19.95

Patient Persistence celebrates the ability of people to overcome obstacles to achieve their goals. Author Adele Gill invited individuals from every background to tell their stories of "hope, courage, hard work, and endurance related to health, disability, relationships, family, ministry, career, accomplishment and challenge."

Ms. Gill is a certified disability analyst/fellow with the American Board of Disability Analysts, and an advocate of inspirational/motivational self-help. She writes, "Patience and persistence are qualities that are vital to the discovery of our finest, God-given gift; the resilient 'Indelible Human Spirit.' These innate qualities propel people and enable them to do great things and overcome significant hurdles."

Patient Persistence is both motivational and inspirational, offering help and hope to anyone who feels that his or her life is out of control, or that things have gotten so bad that there will never be a way to make it better.

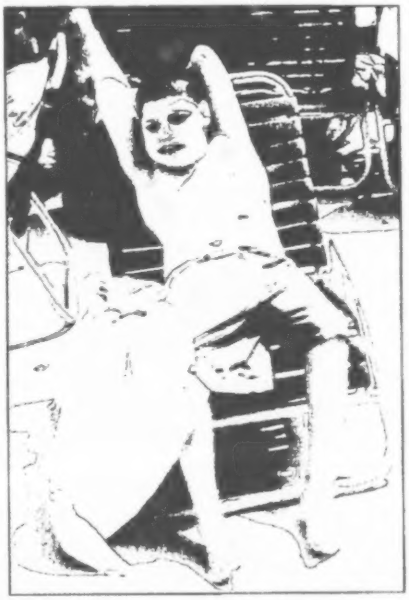
familiar faces

DEENA

Deena Carman Giriyappa, 5, "is the sweetest little girl you will ever meet," says her caretaker Laura Rabida. She has cerebral palsy and brachial plexus. She is a fun, lovable, huggable, happy and determined girl with a great sense of humor. Her smile is so contagious, you can't help but love her. Deena receives many therapies and uses an alpha talker to communicate. She has touched many lives. As she continues to grow, she will touch many more. Deena lives with her loving parents, Eleanor and Pradeep.

JAMES



James Oliver, 13, is pictured taking a break on a summer day. He loves the outdoors, horses, music and swimming. He keeps busy by taking adapted swimming lessons.

JEREMIAH

Jeremiah Francis Caparosa, 16 months, has just received his first haircut at the barber's! His mother **Mona** (pictured holding him) is very proud of him. He has two brothers, James and Nicholaus; his best buddy, Daddy; and Roxy Girl, the family dog. Jeremiah has Down Syndrome and is doing very well.

DANIEL

Daniel Seering, 5, and his sister **Rebecca**, 7, last Easter after an egg hunt. Daniel has fragile X syndrome and has also been diagnosed with mental retardation, autism, ADHD and sensory integration disorder. Daniel likes to play his own versions of hide-and-seek and tag. He also likes to watch TV, look at books, put puzzles together, go for rides in the car, eat out and ride the swings. Daniel receives speech and occupational therapies. He lives at home with his sister and parents, Joe and Kathy. *For more information about fragile X syndrome, please visit: http://www.FragileX.org*

Would you like to share a favorite candid snapshot or slide of your child and/or family with other readers of EP? Send it to: Readers' Photos, EP (EXCEPTIONAL PARENT), 65 E. Route 4, River Edge, NJ 07661. (Please do not send originals or "one-of-a-kinds" as we regret that **photos cannot be returned.**) On a separate sheet of paper, write your child's full name, age at the time the photo was taken, address and daytime phone number. Please identify everyone in the photo. If you like, you can also write a few sentences about your child. Then look for a familiar face in an upcoming issue!

CHILDREN'S NEUROBIOLOGICAL SOLUTIONS

What About the Children?

By Terry Boisot

Palmer Clay Richmond was only two days old when he was diagnosed with a seizure disorder. Eight days later, he underwent two emergency surgeries to remove damaged intestines. By two and a half years old, he had been at death's door four different times. Palmer is now 6 years old; his liver is damaged from the long-term use of anti-convulsants and other medical interventions, and doctors want to remove his enlarged spleen.

"I don't think he would survive the surgery," says his mother, Fia.

Palmer, medically fragile, chronically ill and severely disabled, has endured much at the hands of conventional medicine. Fia said, "We are told that for whatever ails us there is a pill, radioactivity or surgeries to cure us. And if one is unfortunate enough to have an ailment that is not yet curable by our modern medicine, they give no tangible answer, just a turn of their brow and the suggestion of more dope."

Conventional medicine has no "magic bullet" for Palmer. Its interventions seem only to compound, rather than resolve, the enigmas of his physical condition. Time after time he has been sentenced to more surgeries, more machinery, more drugs and more artificial foods, with no hope of ever healing.

Upon Fia's entrance into motherhood and the medical community she was hit hard with the feeling that the world wasn't open to possibilities that would give Palmer comfort in his physical body while at the same time honoring his inherent value, dignity and soul.

Some of society may look at Palmer and see a tragic life, without a voice to be heard, but his mother can hear her son's voice. "I see beyond his physical condition and see who his soul is. No matter how hurt children like Palmer are, they have voices. They are a part of the collective unconscious and soul of the world, and they need to be heard."

In her quest to save her son, Fia opted to create her own story for Palmer—one that conventional medicine could not—one of healing.

This story of healing began one day more than three years ago, as Fia and her husband, Phil, were sitting in the kitchen contemplating the uniqueness of Palmer's physiology and the challenge his health presented to the laws of conventional medicine. It was that day Fia said somewhat jokingly, yet very seriously, "Palmer needs a scientist, not a doctor." The sound of her own words gave her hope.

M. Morton Mitchell, CNS Foundation treasurer, supports research for the benefit of his granddaughter Molly, 4, who is developmentally delayed because of an undiagnosed neurological disorder.

Fia began her journey to obtain more than a casual understanding of biomedicine, the major advances researchers have made in their understanding of fundamental life processes and the use of our own body's mechanisms to repair itself.

"The field of neuroscience, the study of the brain, has transformed our knowledge within these last 10 years, revealing exciting new discoveries that the brain, like other parts of our body, has the potential of healing," according to Fia.

Ten years ago scientists did not believe this could happen; recent advances in biomedicine are phenomena that can be compared with Galileo saying the sun, not the earth, is the center of the universe.

One of the first books Fia read about progress being made in the field of neuroscience was *Inside the Brain*, in which the author, Ronald Kotulak, quotes Dr. Wise Young, "The key to all this is the fact that the vast majority of scientists now believe that the central nervous system can regenerate. They are now convinced that it's only a matter of time before we discover how to make it grow."

As her interest in neuroscience increased, Fia became more aware of articles on the subject appearing in the media, and noted that Dr. Evan Snyder's name appeared regularly. Dr. Snyder, a pediatric neurologist and neonatologist at Boston Children's Hospital and Harvard Medical School, rocketed to prominence ten years ago when he was one of the first to isolate and grow stem cells and suggest that using them might heal brain disorders.

Fia became impressed with Dr. Snyder's work, inspiring her to contact him. After

CNS vice president Sue Ellen Strong (second from right) with her family (left to right): Christopher, Carl and Katherine. Katherine, 4, sustained significant brain damage at four weeks of age due to a viral infection or a vaccine reaction.

spending two hours on the phone with him, she was also impressed with his humanity, and his well-thought-out responses to her questions. The Richmonds decided to raise funds to help support Dr. Snyder's research, and made an appointment to meet with him.

Upon the suggestion of friends, they also arranged a meeting with Dr. Jeffrey Macklis, another neuroscientist and a colleauge of Dr. Snyder. Dr. Macklis' primary interest is human neurogenesis, that is, the birth of new cells of the nervous system, called neurons. It had been a long-held understanding that adult human brains cannot replace dead neurons, leaving scientists with the belief that brain damage is irreversible. However, recently, research has demonstrated that human brains do generate new cells after all, opening up tremendous possibilities for healing.

As Fia recalls the meeting with Dr. Snyder and Dr. Macklis–a meeting that lasted for hours–it was the first time her questions had not been met by the frown and scowl that had become an expected part of what conventional medicine had to offer Palmer. This time, there were answers. "Light bulbs go off in their minds and they circumnavigate a concept—looking at all directions of the problem. Both doctors were extremely respectful and for me it was like hitting a pot of gold."

By the time the meeting was over, the Richmonds knew they had just met two incredible people who held in their minds, their research, and their optimism for the near future hope for Palmer's healing. On the

Circle #55 or visit www.eparent.com/adinfo

continued from page 73

way home, the Richmonds had a serious conversation about a foundation that would support a collaboration of some of the most brilliant minds in the scientific community to focus not on a disease, but on the brain itself.

It didn't take long before that conversation grew into the formation of Children's Neurobiological Solutions Foundation. CNS is a collaboration of parents and eleven world-renowned neuroscientists and clinicians, including Dr. Snyder and Dr. Macklis. They believe that emerging discoveries involving the brain and its ability for self-healing, together with an understanding of the biological states of human development, "are our gateway into a society that will inherit the potential to repair and regenerate the damaged brain, securing a future filled with possibilities for our present and future children."

The CNS mission, "is to orchestrate cutting edge, collaborative research with the goal of expediting the creation of effective treatments and therapies for children with neurodevelopmental abnormalities, birth injuries to the nervous system, and related neurological problems." In addition, CNS strives to provide families and health care providers with user-friendly access to state-of-the-art information and education supporting their decision-making processes.

With Fia's commitment to heal her son also comes a commitment to remaining sensitive and concerned about the disability rights movement, and how the presentation of the work of CNS has an impact on people with disabilities. "I believe that all people have special needs requiring active compassion; one in particular is the need not to be given a limiting label, but rather to be honored in their individuality."

Within its core values, CNS respects, honors and supports the accomplishments of those that have shed light on the inherent value and dignity of people with disabilities. It believes that every individual has the capacity to make a difference and should be respected as a whole–body, mind, and spirit.

As Fia explains, "I'd like Palmer to experience comfort in his physical body. I'm talking about healing his body, not his soul. His soul is beautiful and I would never want to change it," [Fia Richmond,] August 2001.

EP MAGAZINE

SYMBOL OF EXCELLENCE · EP · PARENT · COMMUNITY · CARE

Welcome Resources Technology Edu/Toys Healthcare Subscribe

eparent.com

New! Visit the EP Web site, EParent.com, and discover…

TOYS—The new eToys Web site (www.etoys.com) teams with EP's Web site, EParent.com (www.eparent.com) to offer ideas, information and imaginative toys for families with kids who have special needs. When parents, teachers or caregivers shop at eToys and visit the co-branded EParent.com site, they'll find hand picked toys and games, plus featured articles from EP Magazine. The site also features direct links to the EParent.com shop at eToys, and eToys products recommended by experts or reviewed by organizations chosen by EP Magazine.

EDUCATION—EParent.com's newly-constructed Education channel (EDU/TOYS tab) yields a wealth of current articles on topics such as IDEA, IEPs, assistive technology, transitioning and inclusion. These are supplemented by a growing directory of schools, camps & residences, which can be found in the "Directories" link of the "Resources" channel.

ON-LINE ARCHIVES—Now, EParent.com users can preform keyword searches through our on-line archives and purchase articles which have appeared, as far back as in the eighties, in EP Magazine (recipient of awards from Folio:The Magazine for Magazine Management, Easter Seals, Consumer Healthcare Group). These include classic pieces on such subjects as early childhood, rare disorders, technology, education, medical research update, transitioning, travel, all of which have distinguished EP Magazine through the years.

MORE TO COME IN 2002—You can also click through our EP Library (www.eplibrary.com) which contains books, videos and software encompassing almost 50 specific and general categories, with more than 650 titles. Of course, we will continue to refresh and improve EParent.com in 2002, and look forward to receiving your comments and suggestions. Log on and find out what we are all about!

AUTISM AND THE MMR VACCINE

The National Institute of Child Health and Human Development (NICHD)

Some parents and families of children with autism believe that the Measles/Mumps/Rubella (MMR) vaccine caused their children's autism. These parents report that their children were "normal" until they received the MMR vaccine. Then, after getting the vaccine, their children started showing symptoms of autism. Because the symptoms of autism begin to occur around the same time as the child's MMR vaccination, parents and families see the vaccine as the cause of the autism. However, just because the events happen around the same time does not mean that one caused the other. Although children receive many other vaccines in addition to the MMR vaccine, these other vaccines have not been identified as possible causes of autism.

These parents' beliefs and observations were reinforced by a small study of bowel disease and autism, published by Wakefield and his colleagues in 1998. The study's authors suggested that there was a link between the MMR vaccine and autism. This study did not include scientific testing to find out if there was a link. The authors relied on the reports of parents and families of 12 children with autism to make their suggestion. The study did not provide scientific proof that there was any link. Since this study was published in 1998, a number of other studies have also been published that suggested a link between the MMR vaccine and autism, but none of these provide scientific proof of such a link. To date there is no definite, scientific proof that any vaccine or combination of vaccines can cause autism.

Why do many doctors and scientists believe that the MMR vaccine does not cause autism?

In 2000 the Institute of Medicine (IOM) at the National Academy of Sciences, at the request of the Centers for Disease Control and Prevention (CDC) and the National Institutes of Health (NIH), conducted a review of all the evidence related to the MMR vaccine and autism. This independent panel examined completed studies, on-going studies, published medical and scientific papers, and expert testimony to assess whether or not there was a link between autism and the MMR vaccine. The IOM concluded that the evidence reviewed did not support an association between autism and the MMR vaccine. This and other conclusions from the IOM review were released in April 2001 (Immunization Safety Review Committee 2001).

Also in 2000, the American Academy of Pediatrics (AAP), a professional organization for pediatricians, held a conference on the MMR vaccine and autism. Parents, scientists, and practitioners presented information on this topic to a multidisciplinary panel of experts. Based on its review, the AAP also found that the available evidence did not support the theory that the MMR vaccine caused autism or related disorders. The AAP policy statement appeared in the May 2001 issue of *Pediatrics*.

In 1999, Taylor and colleagues published a study that argued against the suggested link between autism and the MMR vaccine suggested in the Wakefield study. Taylor's study looked at all the known cases of autism spectrum disorder (ASD) in children living in certain districts of London who were born in 1979 or later. Researchers then matched the ASD patients with an independent registry of vaccinations. The results of this study showed that:

❑ The number of ASD cases had increased steadily since 1979, but there was no sharp increase in the number of cases after doctors started using the MMR vaccine in 1988.

❑ Children showed symptoms of ASD and were diagnosed with ASD at the same ages, regardless of whether they were vaccinated before or after 18 months of age. This finding is important because if the MMR vaccine caused ASD, the children who were vaccinated earlier would show symptoms earlier.

❑ By age two, vaccination coverage (the number of children who received vaccines) among children with ASD was nearly the same throughout the region as vaccination coverage for children the same age who did not have ASD. If the MMR vaccine and autism were linked, then a greater number of children who had been vaccinated throughout the region would have ASD.

❑ The first signs of autistic behavior or first diagnosis of ASD were no more likely to occur in time periods following the MMR vaccine than in other time periods.

Also in 1999, the United Kingdom's Committee on Safety of Medicine examined hundreds of reports collected by lawyers of patients with autism and similar disorders that families said they developed after receiving the MMR or MR vaccine. After a systematic, standardized review of the case information, the Committee found that the information did not support any link between vaccines and autism. Based on the evidence, the Committee concluded that there was no cause for concern about the safety of MMR or MR vaccines.

A study done in Sweden in 1998 showed no evidence of association between the MMR vaccine and autism. The study compared the number of autism cases in children from two Swedish towns before 1982, when local doctors first started using the MMR vaccine, and after 1982. The results showed no difference in the towns' rates of autism.

Another study, done in England in 1997, looked at any possible link between the measles-specific vaccine (one part of the

MMR vaccine) and different problems that result from damage to the nervous system, such as learning disabilities and behavior problems. These researchers found no proof that the measles vaccine was in any way linked to long-term damage to the nervous system.

Is there any research going on to find out if the MMR vaccine is linked to autism?

The NIH is doing a number of things to look into the claims about MMR vaccines and autism:

The Network on the Neurobiology and Genetics of Autism: Collaborative Programs of Excellence in Autism (CPEA), funded by the National Institute of Child Health and Human Development (NICHD) and the National Institute on Deafness and Other Communication Disorders (NIDCD) with additional funding from the CDC, are working together to study autism and the MMR vaccine. This research will examine people diagnosed with autism who seemed to develop normally, but then started to show autistic symptoms. This type of situation is called "regression." To learn as much as possible about these patients, researchers will compare them to people who do not have autism, and to people who showed autistic symptoms since birth, called "classic" autism. CPEA researchers will compare vaccination records to see if the onset of autism was associated with receipt of MMR and other vaccines. Lab tests will then look for any evidence of persistent infections that could be related to the MMR vaccine.

The NICHD is also working with other NIH Institutes, the CDC, the Environmental Protection Agency (EPA) and other federal agencies to conduct a large, long-term study of the effects of the environment on children's health. This study will follow 100,000 children from before birth to age 20 to track their growth and development, their genetic blueprints and environmental factors that they encounter. Researchers hope to establish or rule out links between a variety of environmental events and normal and abnormal development, such as autism, asthma, and other disorders that have shown dramatic

Offering New Hope for Children with Cerebral Palsy and Brain Injury

Ocean Hyperbaric Neurologic Center

HYPERBARIC OXYGENATION FOR THE COMATOSE CHILD

There is some hope for the comatose child suffering from severe brain injuries, cerebral palsy, or anoxic encephalopathy. Children with Glasgow Coma scales from 3-5 present tremendous financial and emotional burdens, since these little ones may live for many years. When considering care of tracheotomy, gastric tube for feeding, physical therapy, occupational therapy, speech therapy, nursing care, recurrent hospitalizations, medications, vans, and modifications to the home, expenditures may represent multi-million dollars.

Intensive hyperbaric oxygenation is no miracle, but it provides some hope. In certain instances the child is able to communicate verbally, by computer or word board. Eighty percent have the G-tube removed and seventy percent have the tracheotomies closed. Frequently, bowels become normal and nutrition is re-established. Routine monthly medications are reduced and hospitalizations are markedly decreased. Although few children will return fully to society, substantial improvements will give them a better quality of life in addition to a ninety percent reduction in overall costs.

For more information on hyperbaric oxygenation therapy and life planning, call the Ocean Hyperbaric Neurologic Center at (800) 552-0255.

Coming Soon!

Hyperbaric Oxygenation for Cerebral Palsy and the Brain-Injured Child..

by R. A. Neubauer, M.D.

Dr. Neubauer's new book is a complete guide written for the professional as well as the caregiver of exceptional children. The book describes the latest information on hyperbaric oxygenation therapy including improved brain function as visualized through functional imaging. Clinical and scientific data along with references are included.

increases in new cases within the past few years. The study is currently under design.

Another NIH Institute, the National Institute of Neurological Disorders and Stroke (NINDS), is conducting a retrospective case-control study to identify any molecular markers in neonatal blood of children with autism, with support from the California Department of Health Services and the Division of Bioengineering and Physical Science (DBEPS) at the NIH.

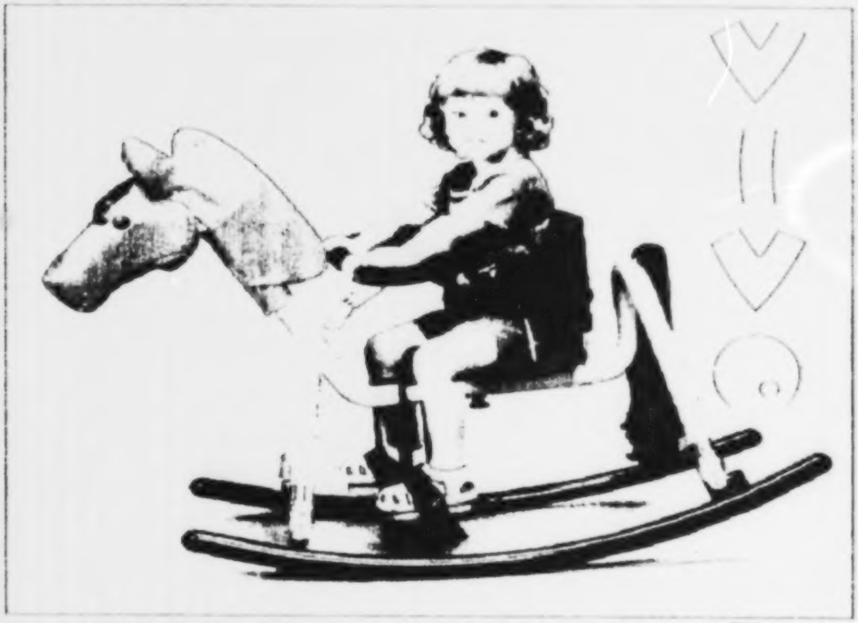
In 1998 the NIH, led by the NICHD and the NINDS, sponsored a conference on ASDs. These and other NIH Institutes formed an expert panel, which also included 15 professional organizations and three parents' groups, and began a review of more than 2,500 scientific articles to develop a system for diagnosing ASDs. The panel published its findings in the Journal of Autism and Developmental Disorders in 1999. In 2000, the panel's report was adopted as a practice parameter by the American Academy of Neurology and the Child Neurology Society. Practice parameter screening and diagnosis of autism gives doctors and other health professionals the first standardized method for diagnosing autism and ASDs based on scientific evidence.

In addition, the NIH is in the process of implementing the autism aspects of the Children's Health Act of 2000. This Act, which was signed into law in October 2000, charges the NIH with the "expansion, intensification, and coordination of activities of the NIH with respect to research on autism." All of the NIH Institutes that fund autism research are working together to establish "Centers of Excellence" to focus on autism research. In addition, the NIH will form a committee with representatives from parents' groups and other federal agencies to coordinate autism research activities throughout the federal government and to enhance efforts to educate doctors and other health care professionals, parents and direct support professionals about autism.

Aren't the diseases prevented by the MMR vaccine mild, when compared to the life-long symptoms of autism?

The diseases that the MMR vaccine prevents–measles, mumps, and rubella (also called German measles)–are actually very serious. Many times, the symptoms and effects of these diseases are just as serious and life-long as the symptoms of autism; in some cases, they result in death. If people stop getting vaccines, the incidence of these diseases will increase, as will the number of deaths and serious health problems.

Measles is a life-threatening disease that spreads quickly and easily. Before the vaccine was available in the U.S., nearly everyone who was exposed to measles got the measles,



R.E.A.L. Design Introduces VIVO™
The New Multi-Therapy Pony

Children will love VIVO, the playful, spirited little pony with the head that bounces when moved and a colorful beaded tail. Parents and therapists will appreciate the valuable skills children gain by playing on VIVO because it functions as a balance rocker or gait trainer by simply interchanging the legs which snap on and off easily. As a rocking horse, VIVO promotes balance reaction skills and upper body postural development. As a gait trainer, it provides incentive for a child to learn ambulation skills. The soft upholstered seat back, with molded laterals, is height adjustable to position children comfortably and securely for rocking or learning to walk. Accessories are available for adapting VIVO to a child's positioning needs.

Circle #44 or visit www.eparent.com/adinfo

three to four million cases each year. The symptoms of measles include a rash, high fever, cough, runny nose, and watery eyes. But if not treated, these seemingly mild symptoms can lead to conditions such as pneumonia, seizures, and water and swelling around the brain. For one in 500-1,000 people, measles causes death. High levels of immunization in the U.S. have led to a 99 percent decrease in measles cases since doctors first started using the vaccine. But in poorer countries of the world, where vaccines aren't as common, nearly 900,000 people died in 1998 from causes related to measles.

Mumps, which the MMR vaccine also protects against, was a major cause of deafness in children before doctors started using vaccines to prevent it. Even though it tends to be mild in children, mumps is dangerous for adults, with side effects that can include paralysis, seizures, and fluid in the brain. Before the vaccine for mumps was available, there were about 212,000 cases each year in the U.S., while in 1998 there were only 606 cases.

The last disease prevented by the MMR vaccine, rubella, is harmful to pregnant women and their developing babies. If a pregnant woman gets rubella, her baby may develop a life-long condition that includes heart defects, mental retardation, and deafness. In some cases, the baby's condition is so severe that the baby dies. In 1964-65, before the vaccine for rubella was available, 20,000 babies were born to mothers who had rubella during their pregnancies. Of those 20,000, 11,600 were deaf, 3,580 were blind, and 1,800 were mentally retarded.

Note: Disease statistics cited in this document came from the National Institute of Allergy and Infectious Diseases (NIAID) at the NIH and the National Immunization Program (NIP) at the CDC.

Should my child have the MMR vaccine?

Both the CDC and the AAP recommend that children receive two doses of the MMR vaccine as long as they have no known health problems that would prevent the vaccine from being effective. The CDC and AAP immunization schedules recommend that the first dose be given at age 12 to 15 months, while the second dose should be given at either four to six years of age or 11 to 12 years of age.

Allergies, immune system diseases like HIV, or other sicknesses can interact with a vaccine to make it less effective. These interactions can sometimes cause other health problems. If your child is sick, your doctor may delay the vaccination until your child is healthy. For example, a child with a fever should not have a vaccination until the fever is gone. Make sure you give a complete description of your child's current health and health history to your child's doctor at every visit, so he or she can help you make an informed choice about the timing of your child's vaccinations.

Differences Don't Count

by Jessica Mercola

I have brown hair.
She has blond hair.

I have long hair.
She has short hair.

I am chubby and short.
She is skinny and tall.

I have braces and glasses.
She has freckles and cerebral palsy.

I can draw, ride a bike and read.
She can't do any of these.

I can walk and sit.
She has a wheelchair,
and tries to talk
but out comes noises,
silly ones.

I like to draw.
She likes to go for long walks.

I am stubborn and loud.
She is sensitive and loving.

I am outgoing and fun.
She is different and interesting.

I go to dance.
She goes to therapy.

I drink from a cup and eat
regular food.
She drinks from a bottle and eats
pureed food.

I like to play outside.
She likes to play with noisy toys.

She doesn't make any choices.
We make them all for her.

I think I have a
good life.
Hers could be
better.

Every day I watch her grow,
in sorrow, laughter and snow.

I hope no one ever takes her away.
I would be lonely and miss her
every day.

I start every day with the positive
attitude that one day she'll be
just like me!

I don't care what we are.
I love her anyway.

I don't care what other people say.
We'll always be sisters and
the best of friends.
That's the way it's going to stay!

EP

MOM'S TURN

Julie A. Jasica-Mercola, Jessica's mom, says:
Jessica wrote this poem as part of a diversity contest at her middle school. While she wrote about a "she," the sibling in the poem is actually a "he," her younger brother, Jimmy. Jimmy is 6 years old; has hypotonic cerebral palsy and profound developmental delay; is non-verbal and non-ambulatory; and has the most gorgeous smile and eyes of anyone! Jessica also shares her home with her younger sister Rebecca, her father Bob and me. We are so proud of Jessica. She is incredibly compassionate, sensitive and hard working. Her poem won her an honorable mention at school and it has captured the eyes and hearts of her principal, our district coordinator for special needs children. She was able to show us, in simple words, the profound depth of her love and acceptance of the uniqueness Jim has brought to our family. She reminds us that, at the end of the day, we are all one of God's creations.

From left: Jimmy, Rebecca, Great Grandma Rose and Jessica.

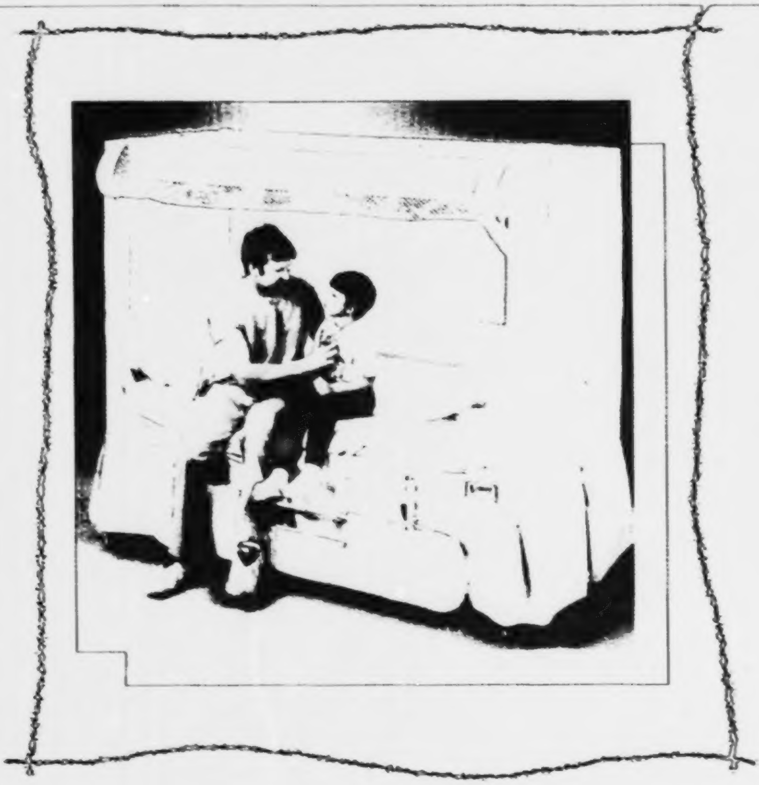
A Better Bedtime Story

The Vail Enclosed Bed



Once upon a time, parents of special-needs children dreamed of a way to make bedtime easier and safer. With Vail Beds, everyone sleeps happily ever after. Your child enjoys the soft, non-threatening security of an enclosed hospital bed—while you enjoy peace of mind knowing they are protected during the night. Vail Enclosed Beds:

- Protect against falls and injuries.
- Reduce wandering.
- Encourage more relaxed sleep—for your child and you.

Vail Beds also accommodate medical equipment; fit all ages from child to adult; feature lifetime service; and come complete with mattress, manually adjustable hospital bed and vinyl border and bedskirt.
Plus, we provide assistance in obtaining insurance approval.

Available from home health-care products dealers, or direct from the manufacturer.

For a FREE catalog, call:

CAN YOU FIND THE SYMPTOMS OF CARNITINE DEFICIENCY IN THIS PICTURE?

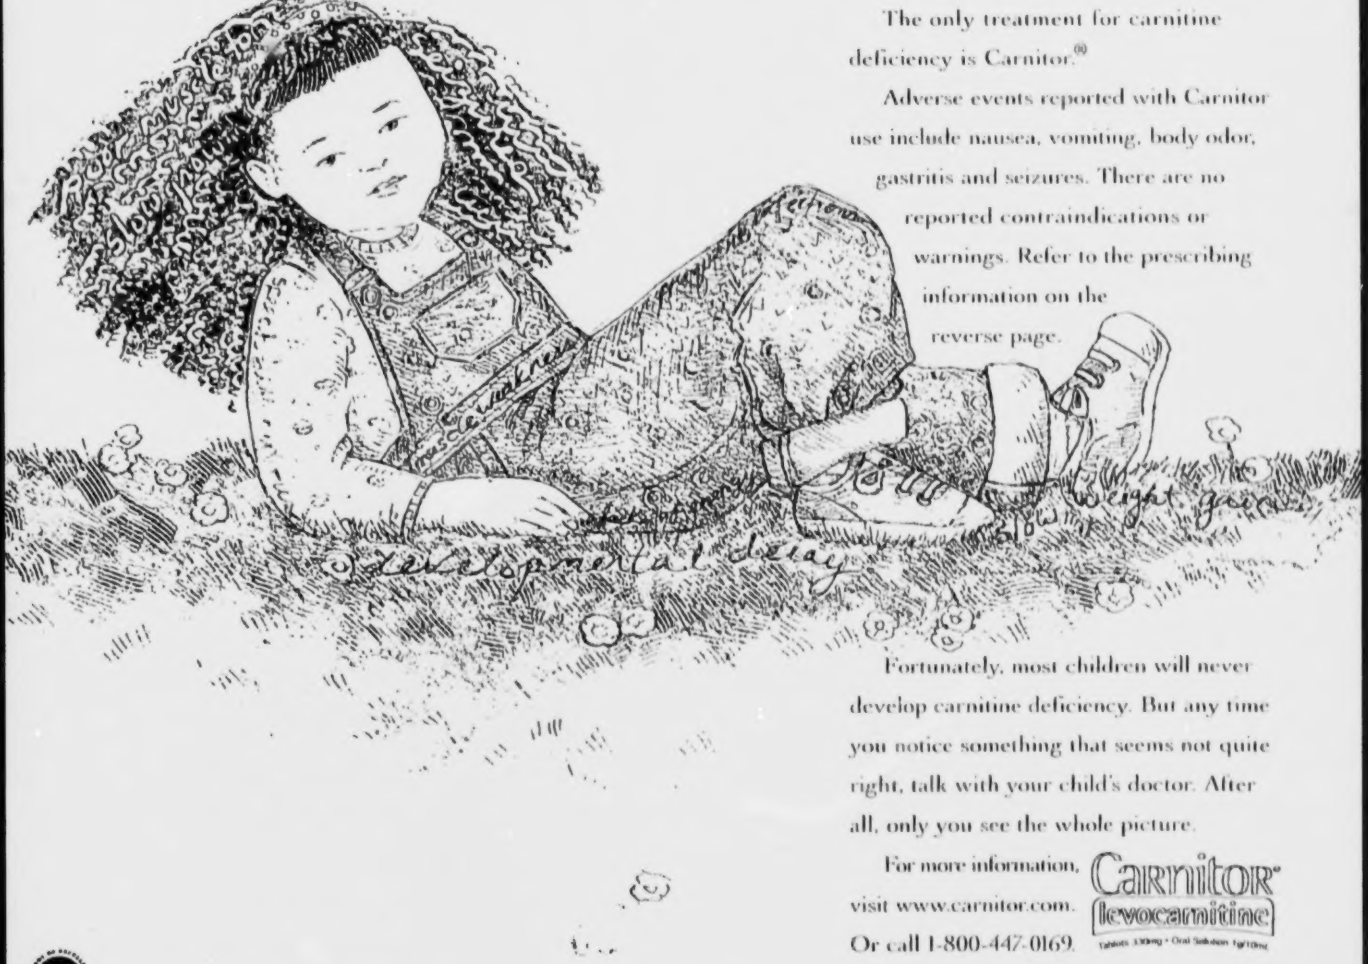
No one knows your child as well as you do. So no one's better at seeing the subtle things that affect your child's health. Things like carnitine deficiency.

Carnitine is a naturally occurring substance that's essential in the metabolic process. If the body is deficient in carnitine, the ability of the cells to produce energy and to remove toxic wastes is impaired. And while carnitine deficiency can be serious, its symptoms are hard to detect and are often overlooked.

Signs include muscle weakness, frequent infection, seizures, poor muscle tone, slow growth, speech difficulties, slow weight gain, lack of energy and developmental delay.

The only treatment for carnitine deficiency is Carnitor.®

Adverse events reported with Carnitor use include nausea, vomiting, body odor, gastritis and seizures. There are no reported contraindications or warnings. Refer to the prescribing information on the reverse page.



Fortunately, most children will never develop carnitine deficiency. But any time you notice something that seems not quite right, talk with your child's doctor. After all, only you see the whole picture.

For more information, visit www.carnitor.com. Or call 1-800-447-0169.

Carnitor®
levocarnitine
Tablets 330mg • Oral Solution 1g/10mL

©2000 Sigma-Tau Pharmaceuticals, Inc. All rights reserved. PA-10

Circle #67 or visit www.eparent.com/adinfo

Carnitor®
levocarnitine

Tablets 330mg • Oral Solution 1g/10mL

CARNITOR® (levocarnitine) Tablets (330 mg)
CARNITOR® (levocarnitine) Oral Solution (1 g/10 mL multidose)
FOR ORAL USE ONLY. Not for parenteral use. Rx only.

BRIEF SUMMARY

The following is a brief summary. Please see package insert for full prescribing information.

CLINICAL PHARMACOLOGY

CARNITOR® (levocarnitine) is a naturally occurring substance required in mammalian energy metabolism. It has been shown to facilitate long-chain fatty acid entry into cellular mitochondria, therefore delivering substrate for oxidation and subsequent energy production. Fatty acids are utilized as an energy substrate in all tissues except the brain. In skeletal and cardiac muscle they serve as major fuel. Primary systemic carnitine deficiency is characterized by low plasma, RBC, and/or tissue levels. It has not been possible to determine which symptoms are due to carnitine deficiency and which are due to the underlying organic acidemia, as symptoms of both abnormalities may be expected to improve with carnitine. The literature reports that carnitine can promote the excretion of excess organic or fatty acids in patients with defects in fatty acid metabolism and/or specific organic acidopathies that bioaccumulate acyl CoA esters.

Secondary levocarnitine deficiency can be a consequence of inborn errors of metabolism. CARNITOR® may alleviate the metabolic abnormalities of patients with inborn errors that result in accumulation of toxic organic acids. Conditions for which this effect was demonstrated are: glutaric aciduria II, methyl malonic aciduria, propionic acidemia, and medium chain fatty acyl CoA dehydrogenase deficiency. Autointoxication occurs in these patients due to the accumulations of acyl CoA compounds that disrupt intermediary metabolism. The subsequent hydrolysis of the acyl CoA compound to its free acid results in acidosis that can be life threatening. Levocarnitine clears the acyl CoA compound by formation of acyl carnitine which is quickly excreted.

Levocarnitine deficiency is defined biochemically as abnormally low plasma levels of free carnitine, (less than 20 µmol/L at one week post term) and may be associated with low tissue and/or urine levels. Further, this condition may be associated with a ratio of plasma ester/free levocarnitine levels greater than 0.4 or abnormally elevated levels of esterified levocarnitine in the urine. In premature infants and newborns, secondary deficiency is defined as plasma free levocarnitine levels below age related normal levels.

BIOAVAILABILITY/PHARMACOKINETICS

In a relative bioavailability study in 15 healthy adult male volunteers CARNITOR® Tablets were found to be bio-equivalent to CARNITOR® Oral Solution. Following the administration of 1980 mg b.i.d., the maximum plasma concentration level (C_{max}) was 80 nmol/mL and the time to maximum concentration (T_{max}) occurred at 3.3 hours. There were no significant differences for AUC and urinary excretion observed between these two formulations.

In the same bioavailability study of 15 healthy adult males, CARNITOR® (levocarnitine) Injection administered as a slow 3 minute bolus intravenous injection at a dose of 20 mg/kg showed that free levocarnitine plasma profiles are best fit by a two compartment model. Approximately 76% of free levocarnitine is eliminated in the urine. Using plasma levels uncorrected for endogenous levocarnitine, the mean distribution half life was 0.585 hours and the mean apparent terminal elimination half life was 17.4 hours following a single intravenous dose.

The absolute bioavailability of L-carnitine from CARNITOR® Tablets and Oral Solution was determined compared to the bioavailability of L-carnitine from CARNITOR® Injection Intravenous in 15 healthy male volunteers. After correction for circulating endogenous levels of L-carnitine in the plasma, absolute bioavailability was 15.1% ± 5.3% for L-carnitine from CARNITOR® Tablets and 15.9% ± 4.9% from the Oral Solution.

Total body clearance of L-carnitine (Dose/AUC including endogenous baseline levels) was a mean of 4.00 L/hr. Endogenous baseline levels were not subtracted since total body clearance of L-carnitine does not distinguish between exogenous sources of L-carnitine and endogenously synthesized L-carnitine. Volume of distribution of the intravenously administered dose above baseline endogenous levels was calculated to be a mean of 29.0 L ± 7.1 L (approximately 0.39 L/kg) which is an underestimate of the true volume of distribution since plasma L-carnitine is known to equilibrate slowly with, for instance, muscle L-carnitine.

L-carnitine was not bound to plasma protein or albumin when tested at any concentration or with any species including the human.

INDICATIONS AND USAGE

CARNITOR® (levocarnitine) is indicated in the treatment of primary systemic carnitine deficiency. In the reported cases, the clinical presentation consisted of recurrent episodes of Reye-like encephalopathy, hypoketotic hypoglycemia, and/or cardiomyopathy. Associated symptoms included hypotonia, muscle weakness and failure to thrive. A diagnosis of primary carnitine deficiency requires that serum, red cell and/or tissue carnitine levels be low and that the patient does not have a primary defect in fatty acid or organic acid oxidation (see Clinical Pharmacology). In some patients, particularly those presenting with cardiomyopathy, carnitine supplementation rapidly alleviated signs and symptoms. Treatment should include, in addition to carnitine, supportive and other therapy as indicated by the condition of the patient.

CARNITOR® (levocarnitine) is also indicated for acute and chronic treatment of patients with an inborn error of metabolism that results in a secondary carnitine deficiency.

CONTRAINDICATIONS

None known.

WARNINGS

None.

PRECAUTIONS

General

CARNITOR® (levocarnitine) Oral Solution is for oral/internal use only.

Not for parenteral use.

Gastrointestinal reactions may result from too rapid consumption of carnitine. CARNITOR® (levocarnitine) Oral Solution may be consumed alone, or dissolved in drinks or other liquid foods to reduce taste fatigue. It should be consumed slowly and doses should be spaced evenly throughout the day to maximize tolerance.

Carcinogenesis, mutagenesis, impairment of fertility

Mutagenicity tests performed in *Salmonella typhimurium*, *Saccharomyces cerevisiae*, and *Schizosaccharomyces pombe* indicate that CARNITOR® (levocarnitine) is not mutagenic. Long-term animal studies have not been conducted to evaluate the carcinogenicity of the compound.

PREGNANCY

Pregnancy Category B.

Reproductive studies have been performed in rats and rabbits at doses up to 3.8 times the human dose on the basis of surface area and have revealed no evidence of impaired fertility or harm to the fetus due to CARNITOR®. There are, however, no adequate and well controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

NURSING MOTHERS

It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

PEDIATRIC USE

See Dosage and Administration.

ADVERSE REACTIONS

Various mild gastrointestinal complaints have been reported during the long-term administration of oral L- or D,L-carnitine; these include transient nausea and vomiting, abdominal cramps, and diarrhea. Mild myasthenia has been described only in uremic patients receiving D,L-carnitine. Gastrointestinal adverse reactions with CARNITOR® (levocarnitine) Oral Solution dissolved in liquids might be avoided by a slow consumption of the solution or by a greater dilution. Decreasing the dosage often diminishes or eliminates drug-related patient body odor or gastrointestinal symptoms when present. Tolerance should be monitored very closely during the first week of administration, and after any dosage increases.

Seizures have been reported to occur in patients with or without pre-existing seizure activity receiving either oral or intravenous levocarnitine. In patients with pre-existing seizure activity, an increase in seizure frequency and/or severity has been reported.

OVERDOSAGE

There have been no reports of toxicity from carnitine overdosage. The oral LD_{50} of levocarnitine in mice is 19.2 g/kg. Carnitine may cause diarrhea. Overdosage should be treated with supportive care.

DOSAGE AND ADMINISTRATION

CARNITOR® (levocarnitine) Tablets

Adults: The recommended oral dosage for adults is 990 mg two or three times a day using the 330 mg tablets, depending on clinical response.

Infants and children: The recommended oral dosage for infants and children is between 50 and 100 mg/kg/day in divided doses, with a maximum of 3 g/day. Dosage should begin at 50 mg/kg/day. The exact dosage will depend on clinical response.

Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution.
For oral use only. **Not for parenteral use.**

Adults: The recommended dosage of levocarnitine is 1 to 3 g/day for a 50 kg subject, which is equivalent to 10 to 30 mL/day of CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 1 g/day, (10 mL/day), and be increased slowly while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

Infants and children: The recommended dosage of levocarnitine is 50 to 100 mg/kg/day which is equivalent to 0.5 mL/kg/day CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 50 mg/kg/day, and be increased slowly to a maximum of 3 g/day (30 mL/day) while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution may be consumed alone or dissolved in drink or other liquid food. Doses should be spaced evenly throughout the day (every three or four hours) preferably during or following meals and should be consumed slowly in order to maximize tolerance.

OBS-2
2/00

All children should be seen. And heard.

With free Verizon assistive equipment, the lines of communication are open to children with disabilities.

If you're the parent of a child with a disability, you know that talking on the phone is just as important to him as it is to every other child. Which is why, if your child qualifies, you should apply for free assistive equipment from Verizon. To qualify, your child must be under 18 and have a certified disability that hinders him (or her) from using the phone, and receive SSI disability benefits.

The equipment covers the range from TTYs and volume-amplified telephones to light signalers, loud tone ringers, and large-number and hands-free telephones.

As you already know, every child has something to say. Now yours can say it on the phone much easier than before. **For recorded information about the program or to request an application, call 1 800 882-6828 (V) 1 800 299-2640 (TTY)**

This is a limited time offer and applies only to New York State Verizon customers or their dependents living in the same household, for as long as our supply of this equipment lasts.

PREVENTABLE
DISABILITIES!

Dear Parents:

When my son was born with cerebral palsy, my family and I had no idea how our lives would be affected. We did not see how vulnerable our child was and how he would need our care and protection for the rest of his life. We did not understand that we would become his life-line in so many ways, and he in turn would consume our lives.

As an attorney, I have become deeply involved in brain injury and other birth injury cases throughout the country.

We would be interested in looking into your child's birth if you had complications either during pregnancy, during delivery, or after delivery.

Our medical staff includes a board certified obstetrician and a registered obstetrical nurse.

Please call 1-800-888-LAWS and speak with either an attorney or a registered nurse.

Remember, there are time restrictions.

Sincerely,

Sheldon O Zisook

TIGER

Fun Fact

The Tiger can easily be placed on several different frames that allow for maximum versatility in and out of your home

Tiger Chair
On our indoor High-Low base, perfect for indoor activity

The Tiger 2000 is a unique and versatile push-chair that combines comfort with a beautiful design. Made for children up to approximately six years of age. The seat easily adjusts from an upright position to a horizontal position. This allows the child to be active or relax no matter where you go. The seat is also reversible allowing the caregiver to maintain eye contact with the child at all times. The unit folds easily for storage or transport.

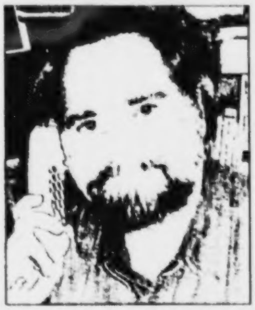
The Value of Observant Observation



When I was a medical student I was always amused when a professor began a story by saying "When I was a medical student…." Usually it was a clinical pearl that he or she had learned at the bedside under the tutelage of some great, memorable professor. Many times it was a reference to an era in which they didn't (couldn't) rely on MRIs, immunoassays or tandem mass spectrometry. "When I was a medical student, we didn't have quick access to thyroid hormone levels, so we would come back to the ward at about six p.m., take the patient's pulse, walk outside on the wrap-around porch and count the number of times the cricket "cricked" in a minute, divided them by two, and had a rough idea of the TSH. Of course it would only work in Burma."

So, to my amazement, I recently found myself starting a tutorial to students by saying, "When I was a medical student…" I guess it's one of the milestones of a physician's career, when what was learned as a medical student, viewed against the backdrop of the current reliance on technology, are "pearls" that are simply lost in the vortex of printouts. The subject was observing and observation—they are not necessarily one and the same—and their value in clinical decision making, not to mention their value in human interaction.

"Concern yourself with the man, lad, not the reports. Observe what's going on or maybe what's not going on here. Think about who's here and what he's all about."

"When I was a medical student," I began (wondering if I had to pay a royalty to the professors I learned it from at the North Middlesex Hospital in London where I trained), I had a professor who always emphasized the significance of observation. He liked to quote the aphorism of Dr. Thomas McCrae, "More is missed by not looking than by not knowing." So one day I was on rounds with this professor as we entered the room of a patient we had been following for about five days for a bleeding ulcer. My hands clenched the fresh reports, notes, lab results and other data I obtained by scurrying around the hospital before ward rounds to provide the professor with the updated clinical picture.

The patient was sound asleep when we entered his room and the professor stood silently at the foot of the bed. After a few minutes the professor turned to me and said "I think he's improving, what do you think?" I was clueless, and started to thumb through the reports to find evidence of "he's improving," because the sleeping patient certainly didn't offer any insight. "You're looking and not observing, Yank" he barked at me as the patient stirred. The professor turned to the patient and said softly, "Sorry to disturb you, Mr. Solomon, we were just remarking about your improved condition. How do you feel today?" Still groggy, the patient said that he was feeling better and that he had finally "paid a penny" the night before (an archaic English expression meaning that he moved his bowels). I found some lab data that indicated that indeed, his condition was improving. The professor turned to me and said, "Forget the labs. Tell me what clues there are to think the bloke's improving." I looked around and there was nothing outstanding that crossed my radar screen, nothing that announced that we should start thinking about discharging him. Actually, I wasn't even sure what I should be looking for; my training so far had emphasized collecting and interpreting clinical data like blood screens, scans that contrasted areas of tissues, fluids and air pockets and levels of every imaginable thing that could be leveled. "Concern yourself with the man, lad, not the reports. Observe what's going on or maybe what's not going on here. Think about who's here and what he's all about." I looked back at the professor with a blank look that I hadn't felt my face form since I was asked three weeks before by my neurology professor to describe the spinothalamic tract. It was enough of a time lapse that my face had almost forgotten how it felt. The face isn't the only thing that feels blank when you come up empty on ward rounds.

The professor turned to me and offered me the equivalent of "are there any final words you would like to say before we carry out the dictates of the tribunal?" Blank again, but with a left eye twitching to demonstrate that my face could do other things.

"I knew our patient was doing better since the last time we saw him yesterday morning because of what's going on here. Look at the table next to the bed. See the book on the table? The bookmark is at least two inches further down the book. Sick people don't read. He's doing better." The labs confirmed the advancing bookmark.

Only when we provide parents with a safe, encouraging milieu in which to share their observations, and we demonstrate our confidence and respect for these observations by following up on them, can we reap the benefits of "parents' eyes."

The professor was quick to point out that clinical decision-making should not be based solely on what you see, but your observations shouldn't be ignored, either. Surely medical advancements have propelled us beyond the significance of a patient's handshake, smell, fidgeting, uncombed hair or ketchup-stained tie….haven't they?

Perhaps no other discipline demands observation—intense, dedicated, purposeful observation—more than developmental disabilities. Clinicians, teachers, therapists, direct support professionals and parents need to look and look hard at people with special healthcare needs. They need to look with all they can see. As Professor Richard Schatzki (*Clinical Aphorisms from the Harvard Medical School*, 1957) hammered home to his students, "The eyes must finish their work before the gray cells take over."

As we've been stressing here at EP for more than 30 years, parents are our most keen observers. They need to be encouraged to share their observations with the rest of the healthcare and habilitation team. Only when we provide parents with a safe, encouraging milieu in which to share their observations, and we demonstrate our confidence and respect for these observations by following up on them, can we reap the benefits of "parents' eyes." Parents have trained themselves to look and think not only out of the box, but out of the clinic, out of the texts and, most important, out of the predictions. Clinicians and professionals should follow parents' lead and start looking for the bookmarks.

THE CENTER FOR CHILDREN • HOSPITAL FOR JOINT DISEASES

Caring for children with
Cerebral Palsy
requires the help of many specialists.

Now you can find them all at
one special place.

The Center for Children is the one place you'll find all the care options you need, with just one concern in mind: your child. By bringing together the resources of the Hospital for Joint Diseases (HJD) and the Rusk Institute of Rehabilitation Medicine (RIRM) of NYU Hospitals Center, we can care for a variety of conditions in one convenient setting. For example, you'll find the widest possible range of treatments for children with cerebral palsy, with in-house specialties including pediatric physiatry, orthopaedics, speech therapy, neurology, neurosurgery, physical and occupational therapy. All in a gentle, kid-friendly environment where there are no white coats, but plenty of color, interaction, toys, games and stimulation. From newborns to 21-year-olds, The Center for Children treats them better. **Call us at 212-598-2330.**

AN EXTRAORDINARY PROMISE — AN ORDINARY LIFE

If you or someone you love has had their life turned upside down by epilepsy, an everyday, ordinary life can be the most extraordinary promise of all.

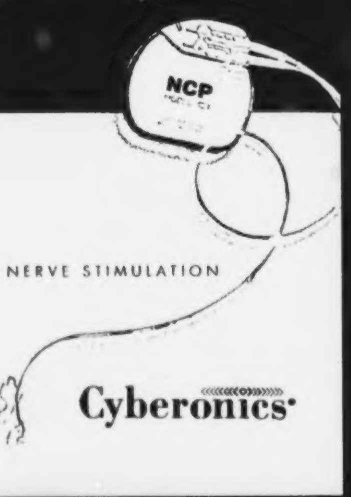
So if you're dissatisfied with the quality of life and seizure control you've had from anti-seizure medications, or you've found their side effects intolerable, discover the difference that VNS Therapy™ can make.

VNS Therapy has been used by over 15,000 patients like Brady with refractory epilepsy that hasn't responded to multiple medication regimens.

If at least two anti-seizure medications haven't worked, ask your doctor about adding VNS Therapy. It's not brain surgery. It's a medical device the doctor implants in the chest, with leads that run up to the vagus nerve in the neck.

It provides significant seizure control for many patients, with no debilitating side effects, and improvement in alertness, fatigue and mood. Some patients are even helped as dramatically as Brady, although VNS results may vary.

BEST COPY AVAILABLE



VNS Therapy is indicated for use as an adjunctive therapy in reducing the frequency of seizures in adults and adolescents over 12 years of age with partial onset seizures that are refractory to antiepileptic medications. See your Neurologist or Surgeon for all reported and potential side effects, warnings, precautions, and contraindications related to VNS.

Do something extraordinary today. Ask your doctor if VNS Therapy is right for you. Call us at **1-866-281-4686**. And visit our Web site at www.cyberonics.com. Your whole life is waiting.

Search & Respond

About Search & Respond

Search and Respond is an opportunity for our readers to exchange information about their practical experiences in meeting the everyday challenges of life with a child or adolescent who has a disability. In this column, "S" represents Search letters and "R" represents Respond letters received about a previously printed Search. "Instant S&R" is a new feature which represents e-correspondence we have downloaded from our Web site. All Responds are forwarded to the writers of the original Searches; some are published. Published letters may be edited for purposes of space and clarity. We also expect parents to consult appropriate professionals.

When sending correspondence, please indicate whether it is a Search or a Respond. For Responds, be sure to note in which issue the original Search letter appeared. Please remember to include a phone number on all correspondence, in the event that more information is required. Write to: Exceptional Parent, Attn.: Search/Respond, 65 East Route 4, River Edge, NJ 07661; Fax to: (201) 489-0074; e-mail to epedit@aol.com; or visit Search & Respond on our Web site: http://www.eparent.com.

For information about specific disabilities, contact: the National Organization for Rare Disorders (NORD), 100 Rt. 37, PO Box 8923, New Fairfield, CT 06812; (800) 999-6673; (203) 746-6518; Web site: http://www.rarediseases.org. Also, see the "National Resources for Specific Disabilities" directory in Exceptional Parent's 2002 Resource Guide (January 2002, starting on page 22).

Each month, Chris Feudtner, MD, PhD, reviews Search & Respond for accuracy and completeness. Dr. Feudtner is a pediatrician at the Pediatric Care Center of the University of Washington in Seattle. Look for Dr. Feudtner's comments on certain Search & Respond letters.

S

Global developmental delay with no diagnosis

My son was born at 39 weeks, blue and not breathing, but with his heart beating. At one minute, he had an Apgar of 2, improving to an 8 at five minutes. For the first two months, he appeared fine until I found him in the crib blue, gasping for air, with blood coming from his mouth. Over the ensuing eight months this occurred eight more times. Despite admission to our Children's Hospital, the reason why this happened was never found.

Now at 3 ½ years of age, he has no speech, and has gross and fine motor delay. His genetic testing has come back normal, as have EEGs, MRI and CT scans. I am desperate as to what to do next. Anyone with any suggestions may e-mail me at roselli@shaw.ca.

Susan via EP web site

S

Galloway-Mowat syndrome

Our daughter, who is 7 years old, was diagnosed with Galloway-Mowat syndrome a couple of years ago. Also known as Microcephaly-Hiatal Hernia-Nephrotic syndrome this is a recessive, genetic disorder causing a variety of physical and developmental abnormalities including: infantile spasm seizures; central hypotonia; cortical visual impairment; microcephaly and kidney failure. She has just received a successful kidney transplant. She's never been genetically tested but she matches all the symptoms.

Our British Columbia Children's Hospital is unaware of any other children in North America who have it. Of course, now that we know she has a future we're interested in knowing about outcomes.

LT, B.C., Canada.

S

Need solution for behavior problems

My 7-year-old son suffered several strokes as an infant which left him with cerebral palsy and moderate to severe developmental delays in all areas. He has some speech, which is improving monthly.

Some of his behaviors, however, are becoming a problem at home and school. He likes to scream out and do heavy breathing. His neurologist says it's self-stimulation. I can ignore it sometimes, but these behaviors are real problems. The neurologist recommended Luvox, but it doesn't come in liquid and my son will not swallow a pill. We therefore started him on Paxil. A month later we see no difference in behaviors.

I don't know how to teach him to substitute a more appropriate behavior. While I realize there's no magic cure, I would be interested to know if others have experienced the same or similar behaviors with their child?

BHS via EP web site

S

Undiagnosed with heart defect, swallowing disorder, neurological issues

I have a 20-month-old daughter with severe delays. She has a heart defect (ventral and atrial septal defects), uncoordinated swallowing (fed via a gastrostomy tube), growth deficiency, short limbs, simian crease on right palm, reflux, and neurological issues (white matter volume loss and immature myelination) All chromosome tests and other tests have come back normal.

We are pregnant with our second child and would love to know more about our 20-month old. I would like to hear from parents with a child who has similar difficulties.

Amy, Columbus, OH

S

Holding a child back in school

My son has developmental delays in all areas—he is 7 years old and functions at the age of a 2- or 3-year-old. He attends public school and is mainstreamed in first grade. I was wondering if any parent out there had held their special needs child back in school.

I would like to know the advantages and disadvantages.

HB via EP web site

S

Motor skills deficit

My 5-year-old daughter is unable to perform simple motor skills such as writing with a pencil, sitting for long periods of time, or walking by herself for any extended amount of time. There is no medical term for it. She is completely on par with children her own age mentally and emotionally.

Does anyone know of any organizations that

I can reach out to for support in helping to find the appropriate schools or programs for her? Also, I'd just like an organization to help myself and my husband cope.

MS via EP Web site

Medication for high tone

My 4-year-old daughter had a near drowning accident shortly before her first birthday resulting in anoxic brain injury. She does not walk or talk, but is very alert and aware of her surroundings. Although her tone is extremely increased at times, her muscles and tendons do not reflect the amount of her posturing. I work very hard to keep her feet, legs, hands, and arms in good condition on the chance that soon she may be able to overcome her physical limitations.

I have debated for several years whether I should put her on medication to limit the amount of posturing she does. It has become increasingly frustrating to see my daughter making efforts to perform a voluntary movement and have the posturing completely disrupt her concentration. It seems that the more she makes an effort to try and do something, the more posturing she experiences. I would be interested in hearing from others who have any experience dealing with such severe posturing.

Shelley via EP web site

Congenital hypothyroidism and mental retardation

My daughter Elizabeth is 13 years old. She was born with congenital hypothyroidism and has been on thyroid hormone replacement medication since she was approximately 16 days old. She was off the medication for two years, from age 9 to 11. She matured physically very early, but has stopped growing in height. Her hands and feet are small in relation to the rest of her. We have been concerned about her lack of academic achievement for several years and now have been told that she is likely mildly retarded. I would like to know if anyone else has had this type of result even with early medication.

DG via EP web site

Instant S&R

Looking for summer solution

Our daughter has partial trisomy 13 which has resulted in a speech and motor delay and some developmental delay. Both my husband and I work full-time. Our daughter has spent her summers in a neighborhood daycare center since kindergarten, but this August she will turn 13 years old and will age out of the center. It would not be a healthy situation for her to stay home by herself all summer, as she is unable to speak (in an emergency) and wouldn't have the strength or agility in her hands to unlock the doors and get out if she needs to.

I am thinking of putting an advertisement in the nearby university newspaper for a companion, maybe a student of special education, who would stay with her on weekdays in the summer and on school holidays.

I would be interested in hearing what other parents in our situation have done or are doing for their adolescents with special needs. I would also be interested in hearing from college students who are studying special education as to whether or not this would be considered an attractive educational opportunity for a student.

LS via EP web site

Our 15 year old daughter, who has Smith-Magenis syndrome and chronic intestinal pseudo-obstruction, has had in-home caregiver-friends for the past five years. Her caregivers provide her with socialization, normal teen activities (malls, movies, etc.) and guide her through her activities of daily living and household chores. We have not had good luck with general newspaper ads but were very lucky at our local nursing school and by word of mouth. In order to make the job appealing, we always ask for more hours than we really need and are flexible with the number of hours. Sometimes this puts us above budget but the quality and consistency of care we have received has been wonderful. My daughter's life would be vacant indeed without the companionship of her "best friend."

HARD MANUFACTURING

AGE APPROPRIATE

BEDS

For when your child passes the crib stage!

Dianna Fitzgerald & Her Son Nicholas

Beds for children once they pass the crib stage are always an issue with parents. . . I can't begin to tell you how terrific the people at HARD Mfg. are. Mary Bias, the rep for the Indiana area told me she knew exactly what I wanted and needed for Nicholas. Thirty-days later the Stockton Bed arrived and it couldn't be more perfect! The Stockton comes in three sizes, with crib type rails, and a height adjustment up to 34"... saving my back! It even has a mounted IV pole for Nicholas' feeding pump. Mary had also suggested the white bed with a red outer footboard and yellow inner headboard...

It truly is the best investment we ever made.

Thank You HARD!
Dianna Fitzgerald

The Stockton features full crib safety sides

- HARD "Age Appropriate" Beds accommodate your child with the safety and convenience you would expect from the nation's #1 manufacturer of hospital cribs and youth beds.
- Available in a rainbow of colorful epoxy finishes and laminate colors to match your room decor.
- Hi-Lo adjustment for convenience and safety.
- Attains all orthopedic and comfort positions.
- Currently available in custom sizes to accommodate all ages.
- Crib type safety sides are close to the mattress to protect arms & legs.

For information about our full line of beds and cribs, as well as locating your nearest HARD dealer, please give me a call.

Participants Wanted for Clinical Trial for Young Adults with Down Syndrome

A large, US-based clinical trial of an investigational drug is currently underway and is recruiting young adults (18 to 35 years old) with Down syndrome to participate. The drug being studied is currently FDA approved for the treatment of mild to moderate dementia of the Alzheimer's type and is being studied in the Down syndrome population for potential improvements in attention, language, orientation, memory, and other areas.

Approximately 160 young adults (male and female) with Down syndrome are being sought to participate in the trial, which will take place in 16 clinical centers nationwide. The study is approximately sixteen weeks long (including screening). Participants and their caregiver/family member will be required to attend a total of four study visits over the study period. The subjects will receive daily oral medication or inactive placebo for 12 weeks and will have a 50/50 chance of receiving mediation or placebo during the study. At the end of the study, all participants will have the option of receiving active medication for an additional 12 weeks.

STUDY CRITERIA

Subjects must be:

- 18 to 35 years old and have a diagnosis of Down syndrome confirmed by karyotyping
- in general good health
- female subjects must not be pregnant
- able to swallow oral medication
- be English speaking
- without sensory or motor difficulties which could affect traveling to the site and completing study requirements (eyeglasses and hearing aids are permissible)
- without another psychiatric or neurologic diagnosis (e.g., major depressive disorder, schizophrenia)

Sixteen centers have been lined up for the study. If you know of someone who may be interested in participating, please contact one of the centers below for more information about the clinical trial. The evaluations and medication in this study are provided to participants at no cost.

CALENDAR OF EVENTS

4/3-6 **CEC Annual Convention and Expo Hilton, New York Hotel, and the Sheraton New York Hotel and Towers, New York City**

Professional development event (parents also welcome) for all who work with students with special learning needs. Conference includes over 600 sessions on current topics, lectures, panel discussions, mini-workshops, as well as exhibition of products and services. Full- or half-day preconvention workshops also available on topics including: behavior management and discipline, curriculum adaptation, assessment, transition, technology and more. For more information contact CEC Customer Service: (888) 232-7733 or CEC Web site:http://www.cec.sped.org.

4/5-7 **11th International Parent to Parent Conference, "In the Spirit of Sharing: Making the Connections," hosted by Parent to Parent of Pennsylvania in Philadelphia.**

Over 75 workshop sessions and several keynote addresses by parent leaders, individuals with disabilities, and professionals in the family and disability field. Formal and informal networking opportunities will be available throughout. Pre-conference day April 4 will feature sessions filled with strategies for starting and expanding a P to P program. For additional information contact Parent to Parent of PA at (717) 540-4722; Web site at http;//www.parenttoparent.org.

Code: PB4978GN
Cost: $29.95
plus shipping and handling.

For over 25 years, Parent to Parent (P to P) programs across the nation have been providing information and emotional support to parents who have a child, adolescent or adult family member with special needs by matching them with trained "veteran" parents who have already been there." *The Parent to Parent Handbook* is a detailed guide, not only on developing a P to P program, but as a primer for new parents who are entering an existing P to P Program. One who wishes to understand administrative, legal or organizational aspects of managing a non-profit group would also find this guide extremely helpful.

The guide is filled with first-hand accounts by parents who have been involved with a P to P program. These testimonials are laced throughout the text to elucidate almost every topic that is covered, allowing the reader to get a glimpse of how a real family who has a member with special needs handles various situations. Each chapter concludes with a summary and a list of all informational resources used in that chapter.

The book discusses the toughest topics first in the section, "Learning About Your Child's Disability." It covers discovering disability and dealing with emotional issues. In handling with the logistical side of the experience, the handbook discusses emotional and social needs of the entire family, financial needs, daily care, medical care and educational rights.

Part 2, expanding upon the discovery theme of Part 1, addresses the issue of finding support. Ideas and suggestions are listed which guide the reader toward finding his or her own support network.

The lion's share of the guide, contained in Part 3, "Starting and Developing a Parent to Parent Program," is dedicated to a basic yet thorough summary of P to P program development from matching parents to planning meetings to incorporating a leadership team. There is also a brief explanation of program funding, fund-raising, public relations or other fruitful organizational relationships. Sample templates, helpful in planning activities, charts, form letters, evaluation forms, sample bylaws and agendas are provided.

The guide concludes with Part 4: "Growing to the Future" and appendices detailing research on P to P programs, suggested readings and contact information. *(Ed. Note—See Calendar of Events for information on Parent to Parent's upcoming conference.)*

The Directory for Exceptional Children

Subtitled "A Listing of Educational and Training Facilities," the Directory contains over 2300 facilities in the US, private and public. The schools, clinics, and programs, both residential and day, are included free of charge and divided into sections for general special needs, including learning disabilities, emotional disturbances, autism, psychiatric and guidance clinics, orthopedic or neurological disabilities, mental retardation, blindness or visual impairments, deafness or hearing impairments, speech and language impairments.

Listings catalogue the facility's "vital statistics," such as contact information, conditions accepted, grades offered, academic orientation and curriculum, therapy and counseling offerings, enrollment, staffing, rates, financial aid, and a description paragraph. The Directory also has a section on disability-related associations and government agencies. In the back of the book are paid advertisements and an index that lists facilities in alphabetical order.

Guide to Summer Camps and Summer Schools

As part of more than 1000 listings, the Guide includes 113 "Special Needs Programs" for participants with behavioral disorders, brain injury, cancer, cardiac disorders, cerebral palsy, deafness, diabetes, dyslexia, emotional disorders, epilepsy, health/fitness, HIV/AIDS, learning disabilities, mental retardation, physical impairments, speech and language impairments, and visual impairments. As with the *Directory for Exceptional Children,* listings are free and include such information as costs, staffing curriculum, session length, age ranges and program description. Paid ads are in the back.

Providing and Protecting Assets

FOR A LOVED ONE WITH A DISABILITY

by Robert M. Fink

Government benefits are often a lifeline for people with disabilities and their families, but preserving eligibility while maintaining quality of life can be difficult. Many states across the country have addressed this problem by adopting legislation for community trusts. This article examines one state's solution, The Georgia Community Trust. (This article is not meant to provide financial investment advice.) —The Editors

The transfer of assets by gift or inheritance, although intended to benefit a loved one with a disability, can in fact be depleted by unnecessary expenses that would otherwise have been covered by public assistance programs. Generally, a person with a disability is entitled to receive both Supplemental Security Income (SSI) and Medicaid benefits. These public assistance benefits are based on the financial need of the person with the disability and are subject to income and asset limitations.

A person with a disability will lose public assistance eligibility if the total assets, after receiving a gift or inheritance, exceed the maximum allowable amount. Similarly, a judgment in a lawsuit for injury or a payment in settlement of a dispute would disqualify a person with a disability from receiving public assistance benefits, if the payment results in total assets exceeding the maximum allowable amount. Therefore, a person with a disability must then use these resources toward costs that would have been covered by SSI and Medicaid and will not qualify for SSI or Medicaid until the assets are depleted.

GEORGIA'S ANSWER

In 1996, the Georgia General Assembly passed and Governor Zell Miller signed into law the legislation making the Georgia Community Trust possible. The Georgia law basically adopted the federal law passed in 1993, OBRA (Omnibus Budget Reconciliation Act) which permitted pooled income trusts as special needs trusts. A trust is a separate legal entity created by a person (known as a donor) transferring assets to the trust. That person appoints a trustee who manages the assets. A pooled income trust is a large trust with many beneficiaries (a beneficiary is a person who benefits from the assets put in the trust). The funds are pooled for investment purposes, but a separate account is established for each beneficiary.

The law is intended to help Georgia citizens provide for the special needs of family members with a disability while preserving assets for the other members of the family. It is also intended to give a person with a disability an opportunity to provide for their own special needs. Under this law, a community trust must be sponsored by a nonprofit corporation, and trustees are required to have experience in business, finance, investment management, and providing services to people with disabilities. To be an eligible beneficiary of the Trust, a person must have a disability that substantially limits one or more major life activities, whether the impairment is congenital or acquired by accident, injury, age, or disease.

THE GEORGIA COMMUNITY TRUST

The Georgia Community Trust solves the dilemma of providing assets for a loved one with a disability. An individual can transfer assets to the Trust for the benefit of a loved one with a disability. A judgment or settlement payment can be made to the Georgia Community Trust for the benefit of the person with the disability. Through this arrangement, the person with the disability does not forfeit basic care he may receive through public assistance programs since the assets in the Trust are not considered assets of the beneficiary. The assets in the Trust can then be used to enrich the life of the person by covering expenses beyond those benefits provided by public assistance. The funds can be used for supplemental education, private rehabilitation, recreation, entertainment, medical and diagnostic treatment beyond Medicaid benefits, services of a direct support professional, and the purchase of furniture for the person with the disability.

The Georgia Community Trust, created in January 1998, currently has 40 beneficiaries and the total amount invested is approximately $2.2 million. It is the only community trust in the state, is sponsored by Ridgeview Institute, Inc., a non-profit behavioral health facility in Smyrna, Georgia. The National Mental Health Association of Georgia is a supporting sponsor organization.

HOW THE GEORGIA COMMUNITY TRUST HELPS FAMILIES

Bob is an 80-year-old widower with an estate worth $20,000. He has two adult sons, Robert and Richard. Robert, who has a developmental disability, has lived in a state institution for 40 years and receives both Medicaid and SSI benefits. Bob would like his estate to help Robert. But if he leaves his money directly to him, Robert will be forced to leave the state institution or will be charged for his care. Bob's $20,000 estate will be depleted quickly and Robert will have to go back on public assistance. Richard will inherit none of his

father's money at either his father's or his brother's death.

The Georgia Community Trust offers Bob a new option. He can place all or part of his assets in the Trust to benefit Robert. Richard can serve as co-trustee to authorize expenditures for Robert's special needs. For example, the money could be used to enroll Robert in a woodshop class at a local community center and can pay for a trip to California to visit Richard and his family—including the cost of a direct care professional to accompany him. At Robert's death the assets in his Trust account will be transferred to Richard in accordance with Bob's wishes.

HOW THE TRUST HELPS A RECIPIENT OF A JUDGMENT

Jim is a 30-year-old man with a disability. He receives monthly SSI payments and Medicaid benefits. Jim is injured in an automobile accident caused by the driver of a truck. He engages an attorney and sues the owner of the truck for damages. A judgment is awarded to Jim in the amount of $20,000. When he receives the payment, he will forfeit his right to receive SSI and Medicaid benefits until his assets are reduced to $2,000. If, however, he transfers the funds from the judgment to the Georgia Community Trust for his own special needs, he will not lose his eligibility for public assistance.

COMMUNITY TRUST WITH INDIVIDUAL ACCOUNTS

The Georgia Community Trust is considered to be one trust fund for investment and management purposes. Individual beneficiaries of the fund have separate accounts to which net income is credited in proportion to each beneficiary's contribution. For example, assume that the trust has ten beneficiaries, each beneficiary receives 10 percent of the income from the Trust. These proportions change depending on expenditures allocated to individual beneficiaries. Assume that $10,000 has been contributed to each of the beneficiaries accounts for a total of $100,000 in the entire Trust. If $5,000 from her account in the Trust has been distributed to cover the needs of Sally, a beneficiary, her allocation percentage becomes 5.16% ($5,000/$95,000); the allocation for the other nine beneficiaries increases to 10.54% ($10,000/$95,000).

The Georgia Community Trust consists of two trusts:

- **Trust I:** The donor (the person who transfers funds into the trust) can select a trust fund based upon desired investment goals. The short-term goal of the Georgia Community Trust I is to keep funds available to meet the immediate needs of each beneficiary and the long-term goal is capital growth. To achieve the short-term goal, trustees invest in a quality money market fund that ensures ready cash. For capital growth, most of the Trust's assets will be invested in a taxable bond fund that provides a high level of current income from diversified portfolios of fixed-income investments. Funds will also be invested in an equity fund of domestic common stocks that pay dividends.
- **Trust II:** The short-term goal of the Georgia Community Trust II is to keep funds available to meet the immediate needs of each benefi-

ciary and the long-term goal is preservation of capital with some amount of growth. To achieve the short-term goal, trustees invest in a quality money market fund that ensures ready cash. For capital preservation with some amount of growth, most of the Trust's assets will be invested in certificates of deposit of national banks and US Government obligations.

APPOINTMENT OF A CO-TRUSTEE

Each donor creating a trust account appoints a co-trustee. The co-trustee, usually a family member, is the liaison between the Trust and the beneficiary who advocates for the beneficiary and requests funds to cover particular expenses.

FEES

Two fees are charged for establishing and maintaining a Trust account. The Initial Enrollment Fee is a one-time $300 fee paid by the person who will transfer assets to the Trust. A Consultation Fee of $400 is charged to cover consultation to the co-trustee. This fee is charged at the end of each calendar year (pro-rated for periods of less than twelve months) and is charged against each beneficiary's account.

PROTECTING A JUDGMENT OR SETTLEMENT PAYMENT

As was seen from the example of Jim, a judgment or settlement agreement may provide for payment to the Georgia Community Trust for the benefit of the person with the disability. The judgment or settlement may also designate a co-trustee and provide for payments to successor beneficiaries. Since the funds resulted from a lawsuit brought on behalf of the beneficiary, the funds will be considered to be donor-beneficiary funds.

SUCCESSOR BENEFICIARIES

When the donor transfers assets to the Georgia Community Trust, successor beneficiaries are designated. Upon the death of the person with the disability, the remaining balance in the account of the beneficiary will be distributed to the successor beneficiary.

DONOR-BENEFICIARY

If a donor designates himself or herself as the life beneficiary (the person who benefits from the trust during his or her lifetime), then the account of the life beneficiary is subject to certain limitations. In such case, the contribution to the Trust is irrevocable (cannot be taken out), and the donor or spouse cannot serve as co-trustee. If the donor-beneficiary designates a successor beneficiary other than the Trust, then upon his or her death, the account balance will be subject to repayment for medical assistance prior to the distribution to the successor beneficiary.

HOW EXPENSES ARE PAID FOR THE BENEFICIARY

A member of the Expenditure Committee of the Trustees will approve all requests to ensure that only expenditures permitted by

the various public assistance programs are authorized by the Georgia Community Trust. Income and principal may be used only to provide non-cash benefits for special needs of the person with a disability beyond the basic support offered by Medicaid and SSI. When these requirements are met, the person with a disability retains his eligibility for public assistance.

MANAGEMENT OF THE TRUST

The Georgia Community Trust is managed by its board of trustees. The following individuals are trustees:

- ☐ Robert M. Fink, Founder and CEO of Ridgeview Institute; former partner of Troutman Sanders LLP, and former partner of Coopers & Lybrand.
- ☐ Ira E. Cavallo, President, The Georgia ARC/Network.
- ☐ Beth English, Executive Director, Southwest Georgia Easter Seal Society, Inc. and past president of The Georgia ARC/Network.
- ☐ Ruthann P. Lacey, Esq., Attorney specializing in elder law.
- ☐ Frank J. Murphy, President and CEO of the EP Foundation for Education, Inc., Atlanta, GA.
- ☐ George Olsen, Investment Vice President, R.W Baird, Atlanta, GA.
- ☐ David P. Pollan, Esq., Attorney specializing in elder law.
- ☐ Theresa Prestwood, Director of Development, Childkind.
- ☐ Cynthia A. Wainscott, Former Executive Director, National Mental Health Association of Georgia.
- ☐ Lynn M. Wilson, Chief Financial Officer, Ridgeview Institute.

GEORGIA RESIDENTS

At present, the individual transferring funds to the Georgia Community Trust for the benefit of a person with a disability must be a resident of the State of Georgia. There are similar trusts in other states and if you are interested in locating one of these trusts, please contact the National Mental Health Association or the ARC Network in your local area. EP

Robert M. Fink is the Executive Director of the Georgia Community Trust.

More information about the Georgia Community Trust is available from their Web site: http://www.georgiacommunitytrust.com or by contacting Robert M. Fink, Executive Director, (770) 431-7070 or via e-mail at: rfink@mindspring.com.

Changing Lives Forever

The Anne Carlsen Center for Children offers a 60-year tradition of residential, therapeutic and educational services on one campus. Our individualized services include care for children and young adults coping with cerebral palsy; orthopedic, vision and hearing impairments; autism, pervasive and other developmental disorders; and many other medical challenges. Our multidisciplinary team can reach out to you by conducting evaluations in your child's home and school setting.

Saving for College With 529 Plans

WHAT YOU NEED TO KNOW

by Timothy E. Lane

According to 2001 Census Bureau data, the benefits of a college education are striking. People with a bachelor's degree earn 83 percent more, on average, than those with only a high school diploma. Over a lifetime, the gap in potential earnings is more than $1,000,000.

The harsh reality of rising costs, though, makes paying for college a formidable challenge for parents. The College Board's Trends in Student Aid 2001 reported that, for the 2001-2002 academic year, the average college cost at a four-year public institution was $3,754 (up 7.7 percent from 2000-2001), while the average cost at a four-year private college was $17,123 (up 5.5 percent). Furthermore, based on the latest expense figures from the College Board's report Trends in College Pricing 2001, parents of a child born last year can expect the average cost of a four-year college education to range by 2019 from $106,000 at public universities to more than $280,000 at private universities. Rising college costs, according to Trends in Student Aid 2001, are burdening more and more students with larger and larger loans. In fact, borrowed money now represents more than 60 percent of all financial aid, compared to 41 percent in 1980.

529 College Savings Plans Offer Help

Over the last five years states have been introducing what are known as 529 college savings programs, which can greatly assist families in saving for college. The programs are named after the section of the Internal Revenue Code which governs them. As a result of recent changes in the federal tax law, they now offer more attractive tax advantages and many plans now have more flexibility than previously. This makes them "a lot harder to resist," according to Business Week, January 28, 2002.

Tax Benefits

As of this year, the new federal tax law says that earnings on qualified withdrawals are to be free from federal income tax. While this federal-tax-free law is schedule to expire in 2010, most experts believe it will be extended. In addition to this federal-tax-free growth, earnings on qualified withdrawals may be either tax-deferred or tax-free on the state level; the benefit is obviously a much larger college nest egg.

But that's not all. Some states, including Idaho, Michigan, Mississippi, Missouri, New York and Oklahoma, offer state income tax deductions for a portion of plan contributions (these programs are managed by TIAA-CREF Tuition Financing, Inc.). The New York, Michigan, and Missouri plans were among Money Magazine's five recommended favorites (May 2001). The other two recommended by Money were Iowa and Utah, which both offer a tax deduction (these programs are managed by Vanguard).

Eligibility

Generally, there are no income limitations or age restrictions for account owners of 529 programs. And anyone can be named as a beneficiary—a child, grandchild, niece, nephew or, if the account owner is thinking about going back to college, the account owner. Account owners can transfer balances to siblings or certain other family members of the original beneficiary. So if one child decides not to go to college, a sibling, first cousin, or other relative can become the beneficiary of an account in the plan.

Contribution limits for 529s are considerably higher than the limits for other types of investments typically associated with funding higher education.

High Contribution Limits

Substantial amounts of money can be invested in most programs. In many, contributions can be made until account balances reach more than $200,000 per beneficiary, and there is no limit on the size to which accounts can grow through investment returns. Contribution limits for 529s are considerably higher than the limits for other types of investments typically associated with funding higher education.

continued from page 25

INVESTMENT OPTIONS

Many state 529 plans offer a managed allocation, age-based investment option, where assets are shifted from equities (stocks) to more conservative, fixed-income investments (often Treasury notes or high-quality bonds) as the beneficiary grows older. Key benefits of this investment option include professional asset allocation and fund management. Some states, in response to public demand, are offering broader choices. California's ScholarShare program, for example, has a 100 percent equity option, a Social Choice equity option and a guaranteed option to go along with its managed allocation option.

When choosing the investment options most appropriate for their needs, investors should consider many factors, including the age of the beneficiary, their own risk tolerance, and their overall financial situation. Higher equity allocations may appeal to those investors who are willing and able to take more investment risk and volatility for potentially higher returns over time, while a guaranteed option may appeal to those investors who are more concerned about preserving principal. Federal law allows investors to change the investment strategy for existing assets in a 529 plan account once per calendar year and/or upon a change in the designated beneficiary of the account. State programs may or may not allow this flexibility.

ELIGIBLE EXPENSES

Withdrawals may be used to pay for tuition, certain room and board expenses, required fees, and books, supplies and equipment, at nearly all colleges and universities in the US. They can also be used for vocational and technical schools, graduate school, and some foreign post-secondary educational institutions. If funds are withdrawn for purposes other than qualified higher education expenses of the beneficiary, the earnings are subject to federal income tax and an additional 10 percent penalty, and may also be subject to state tax and penalties.

ESTATE PLANNING

The programs also offer gift and estate tax benefits that can be significant. For instance, contributions are treated as completed gifts that qualify for the $11,000 annual federal gift-tax exclusion. In addition, an account owner, whether a parent, grandparent, or someone else, can deposit as much as $55,000 ($110,000 for a married couple filing jointly) as a gift in a single year without incurring gift tax consequences by simply taking the exclusion over five years (assuming the account owner makes no other gifts to the same beneficiary during this five-year period).

THE 529 EFFECT ON FINANCIAL AID

According to Trends in Student Aid 2001, nearly 60 percent of students currently enrolled in colleges and universities are receiving some financial aid, and more than 60 percent of all financial aid is in the form of loans. The remainder comes from grants and work-study programs. In determining federal financial aid, only 5.64 percent of parents' assets are taken into account; by contrast, 35 percent of a student's assets are considered. Given that savings in 529 plans are considered parental assets, the plans are clearly advantageous for financial aid eligibility compared to other college financing vehicles, such as Coverdell Savings Accounts (formally known as Education IRAs), pre-paid tuition plans of state universities, and custodial accounts; all these assets are considered to be the student's. When individual colleges decide on financial-aid packages for students, each institution decides how it will treat 529 assets.

Thus, despite what may have been said to the contrary, saving is prudent, even when it comes to receiving financial aid. Although saving in general may affect the amount of financial aid for which a student is eligible, generally loans will be affected. Loan money can't be considered true aid since the money has to be paid back — with interest.

DO YOUR HOMEWORK

When researching 529 programs, parents should understand their own child's likely educational needs; state-specific tax benefits, including any available deductions or matching contributions; management expenses and any other fees; and the investment track record of the program manager.

Investors are not limited to investing in their own state's plan, but rather can take advantage of nearly all plans. They may want to consider their own state's program first, though, particularly if it offers such advantages as state-tax-free growth and a state income tax deduction. Many states' plans are sold directly to the investor, with some featuring annual expense ratios below 1 percent. Other programs, however, are commission-sold by brokers, and thus may cost much more over the long term.

Gina and the Group Home

by Phyllis Donovan

Gina is a beautiful little girl with chestnut brown hair and big fawn eyes. When she smiles, her cheeks puff up like over-stuffed raviolis and her eyes twinkle. On her good days she will come up to me and wrap her arms around my waist or put her velvety hand to my cheek. Gina has been diagnosed with autism/PDD; she has developmental disabilities and no longer speaks. Now that she is almost 10, Gina requires all my attention. She has the mind of a 3-year-old with some abilities of a 7-year-old and the strength of a 10-year-old. She is obviously capable of planning and logic; she has proven this many times with her antics.

> **You should know that this home will be the first of its kind in our county, so there will be much attention paid to the care that the children receive and to what goes on in the home.**

One morning in mid-1999, Gina's Service Coordinator and I sat at the kitchen table and talked about Gina. As I picked up my cup of coffee and began to take a sip, the Service Coordinator said, "I have exciting news. There is a group home that will be opening soon, sometime around January 1." I almost choked on my coffee and said, "Oh no, she's too young! We've considered this as a possibility for the future, but thought that she wouldn't go into any residence for at least eight to ten more years!"

"Well," she said, "Let me tell you what could happen." Should there be a crisis that includes the death of your husband, or you, or both of you, or an illness that is so serious that you can no longer care for Gina, then she could end up wherever there is an immediate placement available, or even in foster care. She could be placed 200 miles away! This home is about 10 miles away from here. The house has been purchased and now all that is left is renovation to accommodate the children. This is an opportunity for Gina and your family that you can't turn down. Since the house will not open for a few months yet, you have time to think about it. You can always change your mind, but if you don't put Gina's name on the list, the placement will be lost. You should know that this home will be the first of its kind in our county, so there will be much attention paid to the care that the children receive and to what goes on in the home. It is a major breakthrough for young people with developmental disabilities, and if Venture (the sponsoring agency) is going to create more homes of its kind, this must work for everyone involved. It will not be another Willowbrook, where the children are mistreated or neglected. You will be involved in everything from the start. You will be able to see the house and meet with the staff before the house even opens! You will not give up parental rights, guardianship is still yours, and the staff cannot even cut Gina's hair without your permission! You can visit any time you wish and take her home at any time for as long as you'd like. Children who have been in group homes like this one have eventually told their parents that they didn't want to go home some weekends because they would miss bowling or visits to the park. They love the activities and friendships they develop. And because she is no longer in your home, Gina will qualify for SSI and will receive a monthly allowance."

When my husband Frank came home from

work, I very carefully told him all the details that I could remember. Frank is a realist, and the thought of Gina being placed in a residence had been on his mind for a while. He knew that we couldn't wait much longer, since both of us were exhausted and worn out. We cannot turn our backs for more than a moment—and sometimes even that is too long. Every outing turned into a disaster. Gina would grab from other people's shopping carts, or run away from me if she saw something more interesting. She was an active, healthy child and I was aging much faster than my years. If we went to a park, it was hard to keep up with her. She was an excellent climber and we just couldn't scale those structures at the playground. Other times she would sit down at the top of the slide and not move for the longest time. Then there was the pain of seeing other people stare when Gina made noises or giggled non-stop. This was beginning to take its toll on us. Even though I didn't say it out loud, I knew that we would end up accepting the placement. Frank knew this too, and didn't hesitate to say so.

And so it began. Every time I thought of the placement, I would cry. We have three older girls: April, then 22; Laura, then 14; and Christine, who was 13. The very next morning they found me at the kitchen table, crying so hard that when they asked what was wrong I couldn't tell them. Each time I began to say it, I would sob.

I drove Christine to school and on the way managed to blubber a little bit out, enough for her to understand what I was saying. "No," she said. "Why do we have to do that?" But I didn't really have to tell her. After all, she lived in a house where all her nail polish was opened and painted on her clothes and on Gina's face, hands, clothes and shoes. She hid all her pens and pencils, only to have Gina find them and mark up her homework or pictures or books. Christine and Laura had no vacation time from school; they spent that time watching Gina while I worked part time. I got home from work at 3:30 p.m., so they couldn't go out until then. They couldn't stay out late the night before because they had to get up with Gina, who slept no more than 8 hours. I let Christine tell April and Laura since I knew that I couldn't tell them without sobbing again. My reactions were upsetting them, too, so I stopped talking about the placement until I could get a grip on myself.

They began to realize that they would have "normal" lives again, and that I would be calmer and able to renew old friendships or even make new friends.

Little by little Christine and Laura were leaning towards the group home for Gina. They began to realize that they would have "normal" lives again, and that I would be calmer and able to renew old friendships or even make new friends. April understood more than Christine and Laura. She had planned her wedding mostly without me, though she involved me when it was possible. Visiting the hall and tasting the cake were done during Gina's respite weekends. I spent my summer vacation running around for fittings and planning a last-minute bridal shower, and went back to work exhausted.

Venture, the organization opening the house, was good. Well known in this county, Venture was started by a woman who had a child with a disability born sometime around the late 1960s or early '70s. I had read her book about her son and the trials of raising a child with a disability without benefit of state aid. Although vague about the circumstances, I remember that at that time there was little help for this child and other children with disabilities. The woman had passed away two or three years before the home was started and one of her sons is now running Venture. The house was the first of its kind in the county and would be under close scrutiny. That made me feel a little more secure about Gina living there without us.

I have a friend in California who teaches children with autism, and I asked her about this home. She thought it would be extremely beneficial to Gina. I asked everyone I knew whom I thought might be helpful for their thoughts on group homes. I looked on the internet for a site about residences so that I could ask questions. I belong to two lists on the internet: both have members who are parents of children with autism/Asperger's syndrome, and I tossed the idea

continued on page 30

continued from page 29

around on one of the lists. To my dismay I received some very nasty emails, so I didn't post again about residences. Two friends on line helped me through some nasty moments, reminding me of the good this would do for my other children, my husband and me. They gave me positives when all I could think of were negatives. They were two of the best friends I could ever have. A friend of my sister was running a group home and I asked her many questions. I never stopped trying to learn what I could about group homes now that Gina would be entering one. That was October 1999, the home opened in October 2001.

All measures were being taken and additional renovation would be done to assure the safety of the children. We left the house a little more at ease.

When the purchase of the house was final, we went to visit. Other parents were there too, but most barely spoke. I suspect we were all feeling somewhat unsure and maybe even a little guilty about the venture we were about to undertake. Possibly these people had heard the same kind of negative comments as I. The CEO of the agency was there, the Service Coordinators were there, the heads of other agencies were there and some of the children were there. We went on a tour, saw the bedrooms and basement, and were told of renovation plans. The basement was still being renovated; padding and carpeting were to be added to ensure that the most active and mobile children could play there safely. All measures were being taken and additional renovation would be done to assure the safety of the children. We left the house a little more at ease.

Because of red tape and protests from the neighbors, the house would not open in January as planned. More meetings, and the budget approval was re-scheduled. To the shock of the agency, it was not approved. The house would not open in April—the proposed budget was too high. Venture had found someone familiar with the state budget approval process to help create a new budget. One problem was a staff nurse. Everyone wanted a nurse at the home, so cuts had to be made elsewhere. I agreed 100 percent that someone had to be there for the children at all times. Another quandary was the renovation. This too had to be approved and inspected, and apparently there were some glitches that needed to be corrected.

With each cancellation of the opening, I breathed a sigh of relief; although we knew it was coming and was necessary, at the same time I just wasn't ready to let go of my little girl.

When the school bus came in the mornings, Gina would giggle and run towards it. She loved school. I would watch her sit down in her seat. There was that little face looking out the window, with those two big eyes that didn't focus on me or seem to recognize me when the bus would return at 3:30 p.m. Those were the moments when I knew Gina needed more than I was able to give her. Those moments would strengthen my resolve about moving her into the Residence, as it was now being called. I was being torn in two different directions. I need her with me, but I needed time for the rest of my family.

A child needs her parents more than anyone else. Who can love her as much, or better? My motherly instincts were frightening me. I had to remind myself repeatedly that Gina warms up to people almost immediately, and that she would be fine. We would visit often and have her come home to visit. Gina needed 24-hour therapy and care, and she would get that living in the Residence.

I had been asked to write a little about Gina's day so the staff would know what she was used to. In order to make her adjustment easier, I wanted to write about her likes and dislikes, her food preferences and which foods she could not eat. I began writing in May and by July my piece about Gina had grown to five pages! I gave it to the Service Coordinator for the Residence staff.

July was our next tentative date. Our minds were now racing; we were caught in a storm of emotions. We wanted the time that this change would afford us but didn't want to say goodbye to Gina. Because she was non-verbal, I could not get any feedback from her. I told her about the house every chance I had, and about how she would be going out and doing things and have someone to care for her every minute of the day. I kept explaining it to her over and over, praying that she was getting the message. One day, while I was telling her of the activities she would participate in, she smiled at me. It was a tiny answer to all my prayers. She seemed to understand, and listened without any sign of sorrow. I had learned to read Gina's expressions and body language and felt comfortable with my instincts about her feelings. Just as I began to feel more secure about the move, though, I would remember that this was different, and I feared that my instincts were protecting me instead of Gina.

Just as I began to feel more secure about the move, though, I would remember that this was different, and I feared that my instincts were protecting me instead of Gina.

In early July we were invited to the house to sign papers and speak with the staff. We had arrived early so we toured the newly renovated house.

The front room was now a recreation room decorated in red, yellow and blue, and the walls were painted with figures from "The Lion King" and "Cinderella." Colorful buckets filled with toys were placed around the room, and a blue table and red chairs were set in the middle. "Pikachu" and "Blue's Clues" pillows adorned a glider in the corner. String, with colored clothespins to hold the drawings and schoolwork of the children, looped around the three connecting windows. An adorable pink bunny hung in the corner. It was beautiful, and welcoming to young children. Smoke alarms and sprinkler systems were in place in each room. The stone ledge of the fireplace this was covered in foam to protect the children from possible harm.

Then we went to see Gina's bedroom. The walls

Offering New Hope for Children with Cerebral Palsy and Brain Injury

Ocean Hyperbaric Neurologic Center

Coming Soon!

HYPERBARIC OXYGENATION FOR THE COMATOSE CHILD

There is some hope for the comatose child suffering from severe brain injuries, cerebral palsy, or anoxic encephalopathy. Children with Glasgow Coma scales from 3-5 present tremendous financial and emotional burdens, since these little ones may live for many years. When considering care of tracheotomy, gastric tube for feeding, physical therapy, occupational therapy, speech therapy, nursing care, recurrent hospitalizations, medications, vans, and modifications to the home, expenditures may represent multi-million dollars.

Intensive hyperbaric oxygenation is no miracle, but it provides some hope. In certain instances the child is able to communicate verbally, by computer or word board. Eighty percent have the G-tube removed and seventy percent have the tracheotomies closed. Frequently, bowels become normal and nutrition is re-established. Routine monthly medications are reduced and hospitalizations are markedly decreased. Although few children will return fully to society, substantial improvements will give them a better quality of life in addition to a ninety percent reduction in overall costs.

For more information on hyperbaric oxygenation therapy and life planning, call the Ocean Hyperbaric Neurologic Center at (800) 552-0255.

Hyperbaric Oxygenation for Cerebral Palsy and the Brain-Injured Child..

by R. A. Neubauer, M.D.

Dr. Neubauer's new book is a complete guide written for the professional as well as the caregiver of exceptional children. The book describes the latest information on hyperbaric oxygenation therapy including improved brain function as visualized through functional imaging. Clinical and scientific data along with references are included.

Hyperbaric Oxygen Therapy [HBOT] is the breathing of 100% oxygen under increased atmospheric pressure. The effects of HBOT on the organs and tissues of the body are multi faceted.*

South Florida Center for H.O.P.E. offers a clean and bright friendly atmosphere, using only state-of-the-art equipment. Our doctors and technicians are trained by a UHMS accredited course and certified in HBOT by the NBDHMT. They come with many years experience in the field of hyperbaric medicine.

* Hyperbaric Medicine Practice
Eric P. Kindwall, M.D.

WE OFFER H.O.P.E.
[HYPERBARIC OXYGEN PRODUCING ENVIRONMENT]

CONDITIONS TREATED WITH HBOT
- CEREBRAL PALSY [CP]
- TRAUMATIC BRAIN INJURY
- ANOXIC ISCHEMIC ENCEPHALOPATHY (AIE)
- NEAR DROWNING
- STROKE [CVA]
- MULTIPLE SCLEROSIS [MS]
- NON-HEALING WOUNDS*
- RADIATION INJURY*
- AUTISM

* CURRENTLY APPROVED BY FDA

ANCILLARY SERVICES
- INTEGRATED MANUAL THERAPY
- PHYSICAL THERAPY
- OCCUPATIONAL THERAPY
- SPEECH THERAPY
- BIO RESONANCE THERAPY
- NEURO-BIOFEEDBACK

continued from page 31

were painted light lavender and, golden oak furniture had been partly stained a grass green. Over the windows were little picket fences with ivy woven around them. Curtains had been vetoed since Gina pulls on them. All aspects of the personalities of the children who would be living there were taken into consideration. Every thing matched and it was beautiful.

The dining room held two oak tables and that is where we gathered for our meeting. The staff congratulated me on the most extensive paper ever written by a parent about his/her child. I was embarrassed but felt the need to have these strangers know every little thing about Gina so that she would be understood and properly cared for. Ten years of parenting Gina gave me a unique perspective on her, and I didn't want anyone to misunderstand her wants or needs. The people running the house told me they were extremely pleased with my paper—I had left no stone unturned! I, in turn, was pleased that they all took notes when we spoke and were jotting down what I myself considered important information about Gina. We sat for about 45 minutes telling stories about Gina, answering questions from the nurse and other staff members, and then the meeting was over.

With the September 11 disaster preoccupying the Governor, papers had still not been signed, and the house could not open. This time it was understandable; but to my surprise, I was disappointed and disgusted.

Once again I felt a little more at ease. The staff would visit us at our house and we would sign a few more papers. I appreciated the way they watched Gina and listened intently when we spoke about her strengths and weaknesses.

This time it seemed possible that the home would open. I was scared and excited because by this time I was really exhausted. My schedule was tight and there was no time for anything other than Gina. The Service Coordinator took care of more legwork and paperwork so that Gina would be ready for the opening.

Around July 20 I received a call from the Service Coordinator telling me the home would not open. Although at the previous meeting we were told that "barring any major disaster" the house was ready, and although they had told us that the budget was approved, the check was still not in hand. We were more than a little confused; this was not the feeling I needed to have about the very people who would be responsible for Gina. They did not give me another date.

Laurie and Christine continued to watch Gina daily throughout the summer vacation, leaving to meet with friends only after I arrived home from work. They began taking turns with her so that they could have full days of vacation time, but she was getting to be too much for the girls.. I would come home to find that Gina had gotten hold of some nail polish, or a pencil, or opened the window and tossed out a block. Gina would run to me and grab my hand dragging me to get snacks and a drink, and would just cling to me.

School, and my rigorous morning routine, began again: up at 6 a.m., get myself together, get Gina up, get Gina fed and dressed, prepare my thermos, and get Gina's snack in her backpack. Go outside and wait for the bus, which came 10 minutes before I was due at work. Run to my car and race off to work.

With the September 11 disaster preoccupying the Governor, papers had still not been signed, and the house could not open. This time it was understandable; but to my surprise, I was disappointed and disgusted. This was my sign that it was "time."

Then I received another set of dates, October 27, 28 or 29, and was told to choose one of the three days. I didn't want to move Gina in on Sunday, because I needed a day at home to fall apart. I needed to adjust to the emptiness, the quiet that would permeate the house, so I chose Saturday. Frank works on Saturdays but this day he took off.

We really didn't believe it was going to happen; still, after being given hundreds of little name tags, I began the job of ironing them onto every piece of clothing she had, including socks, and even some doll dresses. I couldn't think about why I was doing this ironing; I was afraid. Frank didn't call his boss about Saturday, although he had warned him. He too just felt it wouldn't happen on schedule. By Thursday, we had no cancellation call and I began to realize that the Residence just might open on the scheduled date.

Saturday came and I was numb. By packing boxes the night

continued from page 33

before, I kept myself too busy to think. We had breakfast and I stared at Gina even harder, watching her every move, trying to keep all those images inside my mind. I had been doing this since I was told of the home opening all those years back, but today was different. This was the day it would really happen.

We drove to the house in two cars, and when we arrived I was still pretty numb. We went inside and watched Gina run around playing in the rec room. We went into her bedroom to talk to the staff while they unpacked her clothes. They let Gina choose her bed and we laughed as she lay down on it, giggling. Gina took the hand of one of the aides and looked up at her with a little smile. We seemed to be in the way, since most parents had chosen Sunday as the day they would arrive and the staff still had much work to do. I was glad we had picked Saturday, because Gina would not have handled the chaos well. This way, she could acclimate herself to the staff and the house in peace. I finally turned to my family and said, "Maybe we should leave now?" I didn't feel any emotion and, I suppose now, I still wasn't accepting what was happening. The longer we stayed, the harder it would be for me to leave. Gina tried to go with the girls by taking their hands and heading for the door, and that upset them. I explained again to her that she would stay, and we would be back to visit.

Daily, I cried—for Gina, and for what I perceived as the terrible thing that I had done to her. It was getting harder and harder to deal with and I didn't know what to do.

Frank bolted and drove home alone. Christine was teary-eyed and Laura was quiet; there wasn't a sound in the car all the way home. April was waiting as we backed into the driveway. I looked over at Frank and saw him holding up Gina's cup; he had forgotten it and left it in the car. He was red-faced, and I burst into tears. Laura and Christine ran upstairs and ever-bubbly April chattered away, trying to cheer us as much as possible.

I didn't know what to do with myself. That day was the worst in my life. I sat at the kitchen table trying not to think but seeing images in my mind's eye, images of Gina watching her favorite Barney video or playing with her Lego blocks. All the good memories were there; none of the bad ones surfaced. This led to more feelings of guilt and remorse, more questioning of the decision to move Gina to the group home. I knew that we had the option of bringing her home, but I also knew that we would never have any kind of life if Gina were living here.

Every day after Gina moved, I got up, dressed and went to work. I would go to a store, and would see something that would remind me of Gina. I would think "What am I doing here?," then run out to the car and go home. This went on for at least a month. Daily, I cried—for Gina, and for what I perceived as the terrible thing that I had done to her. It was getting harder and harder to deal with and I didn't know what to do.

About a week after Gina moved to the Residence, I came home and looked around the yard: Gina's playground, pretty much the only world she had previously known. Her empty swing set and her trampoline. There was the little blow-up wading pool sitting under her swing just where she left it. I couldn't stand being on the deck where I used to put snacks and a drink for Gina after school. I remembered sitting and watching her play, as she would run from the swings to the trampoline. I had hung old CD's in the trees to scare the animals away from the garden, and when Gina discovered those flashing little orbs, she ran around giggling, and would swing them back and forth.

I thought, "Where is she? What is she doing now? Is she happy, sad, frightened?" I knew that I myself was feeling all of those things. Rather than stand there and fall apart, I grabbed a rake, and began raking the entire back yard. I raked for hours, yet the guilt was growing stronger and I raked on. I raked until I couldn't rake anymore, and realized it was dark. I went inside, exhausted, and started to cook supper. I noticed that a blister had grown and broken without my knowing it or feeling it. Episodes like this occurred sporadically. I would begin to feel sad, guilty, or frightened, and I would get up and clean until I couldn't clean anymore. I would mow the lawn, prune the bushes, deadhead the flowers—any job that required mindless hard work. I couldn't let myself think.

Then I went to visit Gina. It was only a week since she had moved to the Residence, but I missed her terribly. Just deciding to visit her made me feel happier. I went up to the house just after work, and waited at the window, excited that the bus would come and I would see Gina. She got off the school bus looking tired, and headed for the door. In my mind, I had blocked out Gina's autism and somehow fantasized that she would run to me, arms out, and fling herself at me. As Gina walked in the door the aide said, "Gina, look who's here!," but she barely responded. She was hungry—that was never the right time to get Gina's attention. The house was bustling now, with all the children coming in, and I was surprised at how quickly the noise and commotion died down. Gina came to me, and I hugged her.

The visit was a strange experience. I would look at the people at the Residence and know that they were Gina's caregivers now. I was just a visitor in this house. Whether this is true or not doesn't matter. My emotions totally controlled me, and my thoughts were jumbled. I realized that Gina was doing well. When I had to leave, she willingly went into the arms of another aide, and waved goodbye to me in her silly way. It broke my heart, because she wasn't acknowledging me as I had expected her to. I went home and had more crying jags. I thought to myself that I was acting stupid: Gina was happy, and that was what I wanted. I didn't understand myself anymore. All I ever wanted was to know that Gina wasn't frightened or felt deserted and now that I'd gotten my wish, I was still miserable. I seemed to be the only one in my family feeling this way. I realize now that this may not be true; Frank never asked me why I was so upset or why I was crying constantly, yet he seemed to understand.

The following Sunday, Frank could not take my crying anymore, so he picked up Gina and brought her home for a four-hour visit. I was in heaven, and enjoyed watching her play on her swings again. When it was time for her to go she didn't seem upset at all. Although I could not, and still cannot, bring her "home," Frank tells me she's happy when she gets there. Everyone greets her and she runs into the living room to sit and watch television. In retrospect I think that I was jealous of Gina's "new" family.

"School" brings special challenges for a child with special needs

With over 40 years of assisting the child with special needs and his/her family we can offer:

- **Preschool Programs for the Child, age 3 to 5 with:**
  Mild to Profound Developmental Delays, Sensory and Communication Delays, and Hearing Impairments
- **School Program for the Child, age 3 to 21 with:**
  Multiple Developmental and/or Medical Needs including Acquired Brain Injury
- **We Offer All Students:**
  Small Classes with 210-day Caldenar
  On-site Nursing Services
  Assistive Technology
  Customized Adapted Equipment
  Augmentative Communication
- **We Offer All Families:** *(enrollment in school not necessary)*
  PT, OT, Speech/Language Therapy
  Comprehensive Audiological Services
  Family Support Resources (toy library, parent networking & referral, and more)

continued from page 35

Each time I visit Gina at the house it gets a little easier to leave without crying. I believe that she hadn't understood what I meant about her living there permanently, that maybe she thought that it was just another respite house. I see sorrow in her eyes, but I don't believe the sorrow is totally for her; I believe that she knows I'm sad about her leaving us. The staff takes her grocery shopping and feeds her on schedule, with snacks waiting as she arrives home. She is happy, although she misses us. She knows that she can't have the Residence, and all its activities, and us as well. Gina goes swimming weekly, to lunch at the local mall, to an indoor amusement park, the movies and the park, weather permitting. There isn't a weekend that some exciting trip isn't planned. We have Gina's visits scheduled so that she doesn't miss any of these trips.

I hope that someday I see the full benefit of Gina living at the Residence; it's only been three months. I do see changes in Gina, positive changes that make me feel, despite my sadness, as if we've done the right thing.

Now when we visit the house she runs to us. She is more aware, and signing on her own! Although it is minimal, she is signing on her own! She comes home happy, and yet when it's time to go back, she is not sad. She is mellow and solemn but not sad. I think that when I learn to accept this strange and unusual situation and stop being sad for myself, Gina will be happy.

Gina has a friend at the house now. Another child with autism, a little boy around Gina's age, follows her everywhere! Gina normally does not like anyone following her, but doesn't complain about this boy. On a recent visit Gina interacted with us much more. When I visit I always bring Christine with me. This time Christine had brought Pringles, for herself and to share with Gina. Gina put out her hand and Christine gave her a chip. Gina's friend Jerry put out his hand and Christine put a chip into his hand too. On the floor was a little child who has cerebral palsy and does not speak or walk. I was on the sofa so all I could see was Christine, Gina and Jerry. Suddenly a little hand shot up, palm out, Gina flicked her hand at his and the aide said, "Jack wants one too!" This was important, because I had never seen Gina acknowledge any of the other children until this moment.

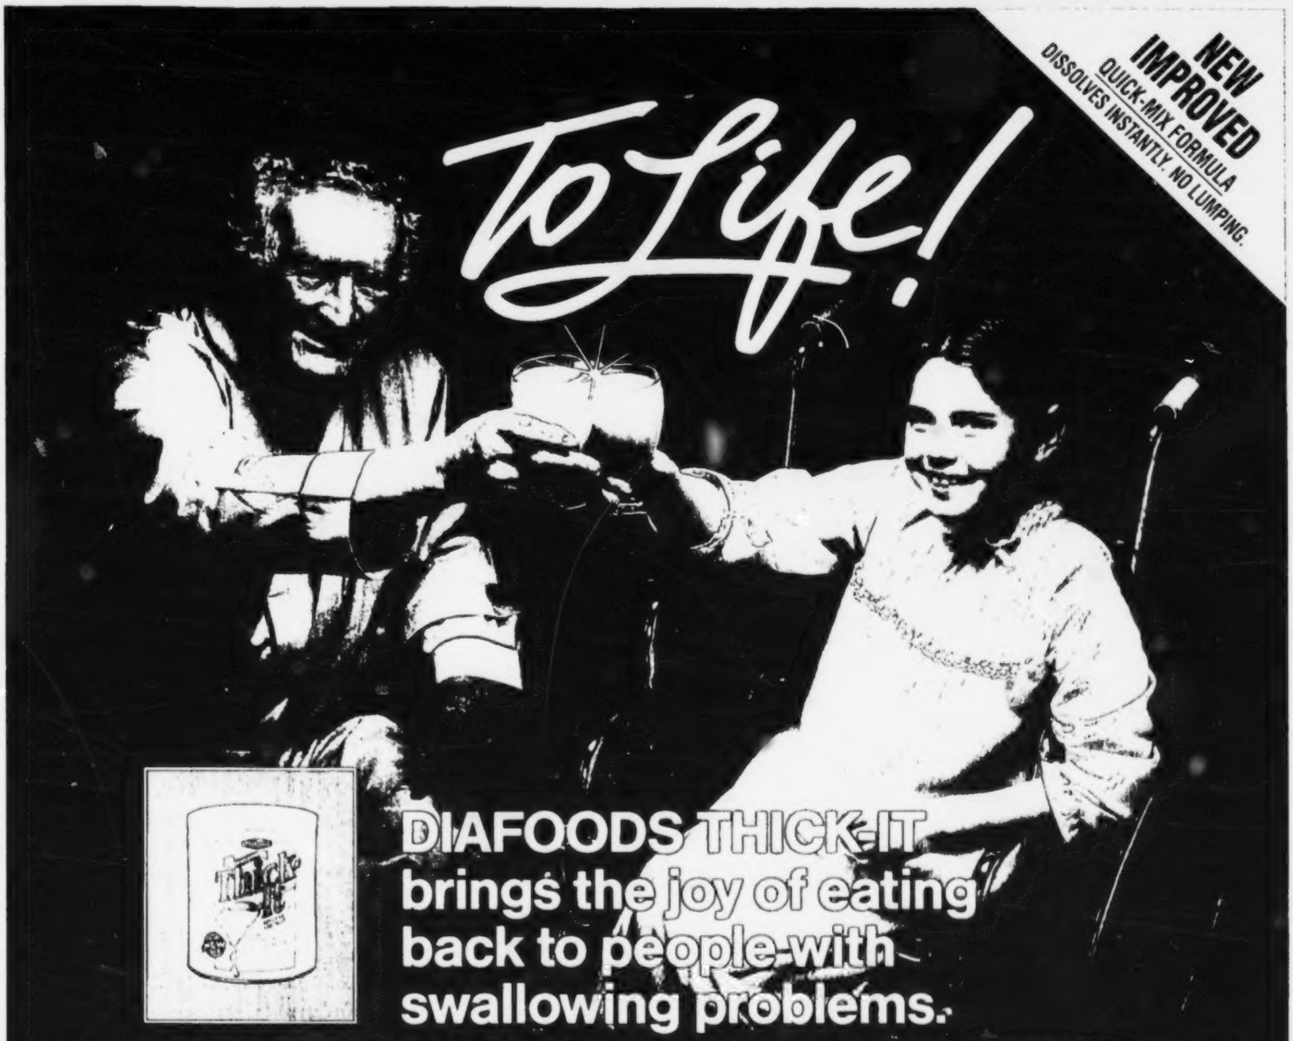
After the Pringles were gone Gina headed into another girl's room. This girl likes to watch videos and she had Disney songs on the VCR. Gina was enjoying the Disney songs—and the companionship of the girl! I watched as she rocked to the music and looked towards the other child. When I called out to her that she should come and visit with me, she waved bye and took me to the door!

I hope that someday I see the full benefit of Gina living at the Residence; it's only been three months. I do see changes in Gina, positive changes that make me feel, despite my sadness, as if we've done the right thing.

When Gina comes home now, there is no need to correct her or complain that she's taking over the living room. Everyone is happy to see her and patient with her. This is what we were no longer able to do with Gina when she still lived with us. Our fortitude was gone. The other family members, who also needed me, resented Gina's constant demands. I resented the lack of time to sit and relax. Gina now comes home and plays with her toys, watches television, and barely clings to me anymore. No more pulling me around because she's bored. She is so scheduled and active at the Residence that she appreciates just sitting here with us. We enjoy each other's company. During Gina's last visit I sang a little song to her as I used to do and she broke out in a huge smile, came to me and climbed onto my lap. Gina stayed on my lap and I continued singing until she got up.

Gina still comes up to me and puts her cheek against mine, or her lips to my cheek to kiss me. She touches my neck with her hand as she used to do, and I talk to her. She is not angry or hurt; she loves us. She's proven that she loves us, and knows us, and that is important to the entire extended family. EP

The Donovans live in the New York metropolitan area.



NEW IMPROVED
QUICK-MIX FORMULA
DISSOLVES INSTANTLY. NO LUMPING.

DIAFOODS THICK-IT brings the joy of eating back to people with swallowing problems.

Here's the solution for the millions of young and old who need modified consistencies to enjoy eating.

DIAFOODS THICK-IT, when mixed with hot or cold, thick or thin liquids and pureed foods, produces any desired consistency quickly, easily and controllably. But it does not change the taste or appearance of the food it thickens.

DIAFOODS THICK-IT adds sixteen calories per tablespoon for nourishment but is very low in sodium for people on sodium-restricted diets. And it helps hydrate patients because it will not bind water or fluids.

DIAFOODS THICK-IT is the market-maker and the #1 selling brand of Instant Food Thickener. It is recommended by speech and language pathologists, dietitians and nutritionists in hospitals, nursing homes and rehabilitation facilities across the country.

For product literature and advice, a free sample and information where **DIAFOODS THICK-IT** may be purchased, **call... (800) 333-0003.**

Free educational material, call... (800) 333-0003.

The booklet **"Dysphagia, A Review For Health Professionals"** discusses causes, evaluation and treatment of dysphagia.

The pamphlet **"Swallowing Problems"** helps patients and caregivers understand and adapt to dysphagia.

Developing "My Dream Portfolio"

by Shelly Weiss, EdS, LMHC, CRC, NCC

Children with disabilities are routinely discouraged from developing their own self-determined quality of life. Expectations tend to be based on the individual's disability label instead of the individual herself. This has been evident to me in both my personal and professional experiences.

Because I was born with cerebral palsy, I have faced disability issues my entire life. While I was fortunate enough to be placed in regular classrooms and earn a standard diploma, for the most part my future was still decided for me based on my disability label. Not that I blame my parents, or the school system, or anybody else for that matter; on the contrary, without my support system I would not be the success I am today. Growing up in a small town, I was raised as an ordinary child instead of one with special needs. Therefore, deep in my heart I had the dreams and ambition of an ordinary child instead of a child with speech and physical impairments. Thanks to my faith in God, I was able to change my future, from the sheltered and safe lifestyle that most people with disabilities have to one that contained the values, interests, and goals of my self-determined quality of life.

> **The "My Dream Portfolio" process derived from the frustration I had experienced in seeing many people with disabilities settling for less in life, unaware of their limitless potential.**

SELF-DETERMINATION IN PURSUING DREAMS

My professional experience comes from my work as a certified rehabilitation counselor/licensed mental health counselor. I've worked with clients of all ages, disabilities, socio-economic statuses, and cognitive levels. Reflecting back the diversity of my interactions, I realize that no matter who I work with, there is one universal treatment goal: encourage clients to dream en route to the development of their self-determined quality of life. When individuals set their sights on something better—a self-fulfilling life—focus is taken away from the problem area and good things start to happen.

Hope and possibilities appear when children imagine the future that they would like to live. Ambition and confidence come alive. A dream composed of the child's self-determined quality of life is formed, including interests, values, skills, preferences and desires. Once that dream is formed (but not necessarily set in stone), excitement and determination become motivational factors for therapeutic process. Sometimes I think I must be missing something because it seems like such a simple process. Why isn't it being implemented everywhere? I've seen it work and have witnessed many wonderful success stories. By helping children create their dream life, I developed "My Dream Portfolio," a process which allows individuals (and family) to create their own options by encouraging children first to dream without limitations, then find ways to accomplish those dreams.

The "My Dream Portfolio" process derived from the frustration I had experienced in seeing many people with disabilities settling for less in life, unaware of their limitless potential. My frustration became most pronounced when I became a transition coordinator, helping high school students with disabilities prepare for post-school living. It sounded incredibly exciting yet simplistic to me. After all, spending most of my life in the "disability circle" of central Florida had given me an abundance of local contacts and resources. All I had to do was connect students with the appropriate resources needed to make their dreams come true. I was ready for the challenge!

The challenge was greater than I had anticipated. When I asked these high school kids what they would like to do after high school, I got blank stares, shrugged shoulders, and responses such as, "let me ask my mom and tell you tomorrow." Even after emphasizing that I wanted to know *their* dreams for *their* lives, most of the 60 or so students could not give me an honest answer.

No one had ever asked them about their dreams before, at least not in a serious manner. Working with these students reminded me that instead of being viewed as individuals with their own set of needs, values, preferences, skills, etc., children with disabilities too often are seen solely in the light of their disabling label. Consequently, these kids automatically inherit expectations and limitations based on the perceptions and/or knowledge of the dis-

Sharing the Caring

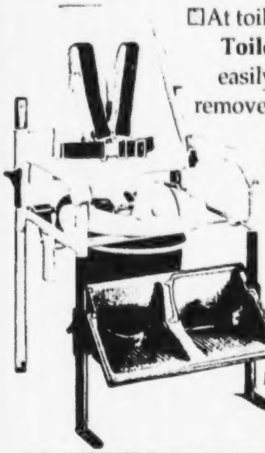
Sally, 40 lbs. and 45" tall, in the #8600 Reclining Bath Chair with #8875 Head Pad

BEST COPY AVAILABLE

Columbia offers you solutions to the daily challenges of bathing, toileting and transporting your child – *with comfort, safety and ease!*

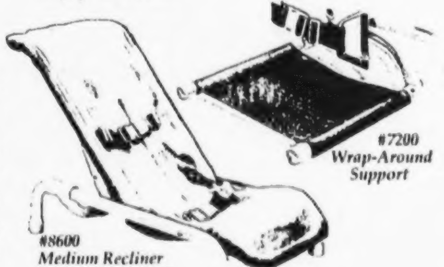
You and your child face some tough challenges, but you're the one who must solve them in the most practical ways. Here's how we can help:

☐ At toileting time, our **Toilet Supports** fit easily onto any toilet; remove easily, too. And our **Positioning Commodes** give the same toileting support in any location.



#5800 Hi-Back Positioning Commode for junior adults

☐ At bathtime, our popular **Wrap-Around Bath Supports** and **Reclining Chairs** allow your child – and you – to enjoy the bath.



#7200 Wrap-Around Support

#8600 Medium Recliner for a child 40"-54" tall, up to 130 lbs.

☐ When your child has outgrown that infant car seat, you can have peace of mind knowing that the **Columbia Car Seat** has been crash tested for children from 20 to 102 lbs.–yet weighs only 11 pounds! Comfort, style and adjustability have made it the No. 1 choice since 1986.

#2000 Car Seat

Why do these products work so well?
Much thought and care go into the design of each Columbia product. We make each item in the **right size for your child**, with lots of adjustability for a custom fit. They are made of durable materials, proven in real life. Made in the USA and sold all over the world, Columbia products are leaders in *all* their categories.

Get all the details from our FREE full color catalog. "Sharing the Caring" means *products that work!*

continued from page 38

ability from people involved in their lives. As a result, they go through life believing their options are limited.

LOOKING AT ALL THE OPTIONS

I make it a rule when facilitating "My Dream Portfolio" never to tell someone that his or her dream is unrealistic. By discouraging the exploration of the child's ideal life, no matter how impossible it seems, I would miss the chance to learn what truly matters to the child. One of my favorite examples of this is my student who wanted to be an astronaut. Since he was on a special diploma and not "college material" (according to his teachers), he was ridiculed whenever he'd share this dream. However, when he trusted me enough to share his ambition with me, I asked him to describe what his life would be like as an astronaut. His eyes lit up and with a face full of excitement, he replied, "Well, I get to wear this bubble helmet." When I encouraged him to go on with his description, he continued describing the space helmet.

This student had no idea what being an astronaut entailed; all that he knew about the profession was what he saw on television. After further discussion, he revealed that a major part of his quality of life was being able to wear a bubble helmet. When we discussed it, we came up with the idea that working in a costume shop where he could wear such a helmet at his leisure would be his dream job. Without exploring his so called, "unrealistic" dream, we would never have discovered what was important to him.

Often, we set goals only to change or modify them as we gather new information and experiences. If I had not pursued my dream of being a clinical psychologist, I never would have found my niche of rehabilitation counseling. I remember being 8 years old and dreaming about being a psychologist specializing in disability adjustment issues. Of course, since I have slurred speech and wasn't considered college material, my dream was almost as unrealistic as the one of employing Tom Selleck as my personal secretary! Yet I ended up pursuing my dream, even after finding out that only a handful of students per year are accepted into the clinical psychology program. It wasn't until my final year of undergraduate studies that I learned of rehabilitation counseling; not only was admission to the program much more likely, but the job description was exactly what I had always dreamed of doing. As far as my speech impediment was concerned,it has turned out to be an asset, for the most part, because I can relate to what my clients are going through.

For this reason, I encourage children to dream and share as many details of the dream as possible. There's an old saying, "I'll believe it when I see it." Well, "My Dream Portfolio" embraces the opposite as a basic premise: "I'll see it when I believe it." If the individual is not able to imagine the dream, how is she supposed to implement the dream? Having the child describe it shows me the child's perception of a goal, whether it is a job, living independently, marriage, or any other life goal.

SETTING NO LIMITS

"My Dream Portfolio" also helps the individual view the consistency of his goals in the context of an ideal day-to-day life. For example, students who plan to work at a minimum-wage job, yet want to drive a sports car and live in a mansion, are shown basic budgeting skills. I give them a brief lesson on the value of money in order to help them understand the importance of setting priorities. There's no reason why someone with a minimum wage job cannot buy a sports car as long as the car payment and insurance are the only bills he has. The same concept is used with students who hate school, yet want to go to college. Instead of telling them they cannot pursue their dream, I show them a 250-page textbook, explaining they'll be required to read one of these per week. They decide whether their dream is worth the effort, or if they prefer to find alternatives.

Frequently, I hear parents tell me that "My Dream Portfolio" would not work with their child because of the severity of limitations, yet I have not met anyone who could not benefit from the process. To prove its adaptability, I have used my cat, Zoey, as an example. I know what makes her happy, what she's good at, and what an "ideal" day would consist of for her; her quality of life is made up of lots of nap time, playing with her brother, Seminole, and a limitless supply of wet cat food. That would make her happy.

> **"My Dream Portfolio" also helps the individual view the consistency of his goals in the context of an ideal day-to-day life.**

Children with disabilities deserve to have input into their future. While the amount of input will vary from child to child, so will the components of their quality of life. The best way to learn about the child's dream is to get to know the child. **EP**

The 5W's of Finding A Counselor

by Audrey L. Canaff, PhD, NCC, LPC

From time to time, families of children with special needs may decide to seek professional counseling to assist them with the problems of everyday living. Counseling can be a mysterious process. Often practitioners in the field disagree on what counseling is, who should be doing it, and what process or processes unfold in the counseling relationship. As a counselor educator, I am charged with teaching counselors in training who may come into the field with their own assumptions and misconceptions. Part of their journey toward becoming a counselor is learning to articulate their own definition of ways of working with and helping individuals. If the process seems vague to counselors in training, imagine what it feels like for a person seeking counseling.

As a way of clarifying the enigma of the counseling field, let's look at the "5 Ws" of counseling; the why, when, who, where and what.

WHY AND WHEN

Families of children with special needs face challenges from a number of fronts and may feel stress from various sources. These can include spouses, family members and the community at large. Some specific scenarios that families with children who have special needs may find themselves in warrant counseling.

Family systems theory is the belief that all members of a family unit are interconnected and dependent on one another. Any change in one member will affect other members. The presence of a child with special needs will affect other siblings within the family unit. Counseling may be needed when siblings begin to have school difficulties, interpersonal problems or express jealousy and anger toward their sibling. In the same vein, marriages may suffer, as the focus of the family may lie in the care, support and advocacy needed for the child with special needs.

Families often experience isolation from the community. Children with special needs may not be included in playgroups, birthday parties and many of the childhood rituals that unite parents in a community. The lack of knowledge about the child's condition and discomfort experienced by some will increase the sense of loneliness and alienation. In addition, the family of a child with special needs expends a great deal advocating for the appropriate medical care, education and socialization necessary for their child's quality of life. This constant up-hill battle can produce stress and burnout. The lack of support from both the smaller community and society at large can result in feelings of sadness, isolation and anger. Counseling can provide a support system to help caregivers with these emotions.

A multitude of emotions surface when parents have a child with special needs, including guilt, anger, fear and anxiety. Many parents may feel guilty about experiencing such emotions and often have no outlet to express them. If social support is lacking, these conflicting emotions can lead to a variety of serious consequences including depression, marital problems, anxiety disorders and difficulties at work.

WHO AND WHERE

Among the most confusing aspects in seeking counseling is identifying an appropriate counselor and where to start to look for one. Counselors go by many names and the alphabet soup of initials, certifications, licensure and educational requirements vary from state to state. There are certain restriction concerning the use of the titles, but most consumers of counseling services are not familiar with them and as a result often enter counseling not fully aware of the credentials their counselor possesses. In an era where car buying has become a science and resources abound, the average consumer of counseling, on the other hand, has little knowledge of who and what is out there.

There are no legal restrictions on the use of the title "therapist" or "counselor." The term counselor is so overused that you can call a travel agency or insurance firm and be connected with a "travel counselor" to assist you. Individuals calling themselves counselor or therapist need not hold any specific educational training or degree. Be very wary if these titles are used without additional licensure, certification, or professional affiliations.

There are legal limitations on the use of the titles psychologist, licensed professional counselor/certified counselor, and licensed/clinical social worker. Psychologists are individuals who possess a PhD in psychology. Psychologists who provide counseling services generally have education and specialization in the field of clinical or counseling psychology. Counselors have a minimum of a masters degree in counseling. In some states, counselors may be licensed by the state board. Other states do not have licensure requirements in place and counselors may elect to become board certified through the National Board for Certified Counselors (NBCC). To become either licensed or certified, counselors must pass an exam and document their graduate training supervision and work experience. Consumers considering seeking counseling services from an individual who identifies himself as counselor should ask whether he is nationally certified (NCC) or licensed (LPC). If this person is neither, continue to look for a counselor who is certified or licensed. Social workers also provide counseling services and their licensure requirements also vary from state to state.

The titles can differ from licensed social worker to clinical social worker. Once again, be sure to check whether the social worker you are considering has the necessary accreditation that is required in your state.

Providers of counseling services often have numerous initials after their names that in some cases have meaning and other cases may be meaningless and misleading. Legitimate providers will share their certification or licensure background information willingly, including their identification numbers (usually needed for insurance reimbursement). A counseling professional's commitment to the certification and licensure process indicates that she abides by the code of ethics of that field. Commitment to the code of ethics protects the consumer of counseling services from unethical practices.

In addition to the issue of certification and licensure, counseling professionals should be affiliated with their parent professional associations. Along with the process of certification and licensure, this indicates a dedication to ethical and professional practice. In the field of psychology, the professional association is the American Psychological Association (APA). In counseling, the American Counseling Association (ACA) represents counseling professionals. Social Workers are represented by the National Association of Social Work (NASW).

Consumers considering counseling with an individual without certification, licensure and professional affiliation, should shop around some more. Many people have been hurt by so-called counselors because of their lack of knowledge about how to navigate through the sea of titles in the field.

WHAT

Some individuals are hesitant to seek out counseling for fear that "counseling won't work." Counseling is not a magic pill or tonic. When counseling doesn't work it is often due to a failure of the relationship between the client and the counselor.

Often, counseling doesn't work because clients come into the counseling process with little or no idea of what to expect. Counseling is a process in which the client and the counselor collaborate to help the client work through difficulties. Effective counseling occurs when a therapeutic relationship is developed between the client and the counselor. A successful counseling experience involves the counselor imparting a feeling of empathy, respect, and attentiveness toward the client.

Many individuals come into counseling expecting a miracle cure to occur after only one session. This is unrealistic, as the counseling process is grounded in the counseling relationship and that takes time, just as any relationship does. In the initial session, the counselor may spend time obtaining history about the current problems that bring an individual into counseling. This is often frustrating for the client who seeks an immediate "answer" to his difficulties. A good counselor, however, assists clients by helping them find their own answers through exploration, clarification, and identification of options.

Many counselors will provide clients with an informed consent that outlines the parameters of what will occur during the counseling process. This will include information on the counselor's background, credentials, fees, length of sessions, and treatment methods. Counselors use different types of treatment methods, and clients should ask what to expect during the counseling process. If a counselor appears uneasy or hesitant in answering these questions, this is a sign that the search for the right match should continue.

An important aspect of counseling for individuals with children who have special needs is the degree to which the counselor has had experience in working with similar problems. This is an individual decision,

continued from page 43

but a good counselor who lacks knowledge about the child's condition, should be willing to research it. Giving the counselor articles and materials pertaining to the child's disease will help him understand the situation and the issues faced by the client. If the counselor does not seem open to this, the search should continue for another counselor. While the counselor may be more experienced in the counseling process, the parents are the experts on their child's condition.

MAKING THE CHOICE

The decision to seek counseling is often a tough one. Some people mistakenly see counseling as an admission of defeat or a sign of weakness. Entering into a counseling relationship means that an individual is willing to explore potential options and alternatives to her difficulties. The experience of being in counseling can result in a stronger support system and a sense of personal empowerment. **EP**

research reflections

THE MYSTERY OF FAMILY RESEARCH:

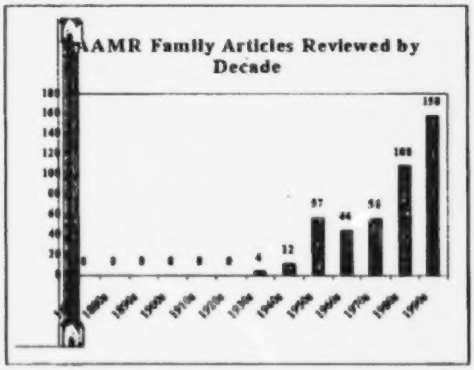
Parents magically change from invisible to prominent

by Jan Blacher, PhD

Consider this headline: "Parents and families of children with exceptionalities are now key players in the burgeoning field of family research." It wasn't always that way, especially for parents of children who were mentally retarded.

Parents of children with mental retardation and related disabilities enter the 21st century with more support than ever before. Most important, the legal mandate for a "free and appropriate public education" provides essential rights, albeit creating yet more responsibilities. New family supports are emerging to meet the child's vocational, social, and residential needs. Yes, of course there's still a way to go, but if we could go back 100 years, or even 50 years, we'd see how far we've come.

I did that time-traveling over the past century, although in the safety of a library and the national office of the American Association on Mental Retardation (AAMR). Over the last couple of years, colleagues and I reviewed more than 500 papers published by the AAMR. Dr. Bruce Baker and I selected 32 of the most meritorious for a just-released book, *The Best of AAMR: Families and Mental Retardation*. We uncovered a mystery of scholarly attention to families—its absence. For 60 years there were no AAMR journal papers that spoke to family issues and concerns. Indeed, from the first published paper in 1876 (in something lightly called *The Proceedings of the Association of Medical Officers of American Institutions for Idiotic and Feeble-Minded Persons)* until 1939 (in the curiously-named *Journal of Psycho-Asthenics*), the family was essentially invisible. The few early references to families were in articles pertaining to "family care," which ironically meant that the child or young adult with retardation would live in someone else's family! "Family care" in the 1930s was most similar to our current idea of foster care. Biological families were believed to have provided "poor parentage, physical disorder," or generally "bad environments" which contributed to, or even caused, their child's retardation. Those years, when retardation was disparaged and leading professionals advocated sterilization, institutionalization, and restrictive immigration, were not kind to natural families. It is not surprising that family members were essentially excluded from any participation in treatment.



Excluded from involvement in your child's treatment? This would be unheard of today, in practice, policy, or research (just peruse the issues of EP). Oddly enough, a paper that was published in 1939 by Harold Skeels and Harold Dye, *A Study of the Effects of Differential Stimulation on Mentally Retarded Children*, countered the anti-family sentiment and foreshadowed interest decades later in early intervention and parent training. Although this now-classic study did not involve biological families, the investigators did put forth a strong case for providing intense personal contacts in an enriched environment for very young children with retardation. The infants that Skeels and Dye moved from an orphanage to an institution, where they were mothered by staff and residents alike, had dramatic increases in IQ, from an average of 64 to 92!

By the 1950s and 60s, there was a surge of interest in families, although it would still be awhile before researchers recognized parents as worthwhile and accurate informants. Early papers were framed by clinical perspectives, focusing on parental reactions to a child with mental retardation, and advocating for addressing presumed parental distress through counseling. Some parent voices did begin to frame the research agenda, though. I especially like a 1959 paper by Mrs. Max Murray (as she identified herself), *Needs of Parents of Mentally Retarded Children*. A sophisticated needs assessment survey disseminated by researchers today could not come any closer to the mark than the observations Mrs. Murray shared. She wrote about six basic problems faced by families: difficulties

Dr. Jan Blacher is a Professor in the School of Education at the University of California, Riverside, and had been a researcher for over 25 years. She is currently the principal investigator of the UC Riverside Families Project, a study of families of children with severe disabilities. Over 600 families have been involved in the Families Project research; their participation has contributed to our knowledge about family coping, the cultural context of retardation, dual diagnosis, and the transition to adulthood. Dr. Blacher has developed Research Reflections as a forum for communicating exclusively with parents. The purpose of this column is to provide "news you can use." She is eager to read your reactions to Research Reflections and any suggestions you might have. Send email to: jan.blacher@ucr.edu.

in initially accepting the child's diagnosis of mental retardation; stress from the child's daily care needs; theological conflicts concerning acceptance of the child with disabilities; financial concerns; anxiety over lifetime care for the child; and inept, inaccurate and ill-timed professional advice. These issues still resonate today.

At this same time, beginning in the early 1950s, parents like Elizabeth Boggs were making their voices heard and actions felt through their fledgling Association for Retarded Children (ARC). By the 1970s this advocacy and service organization had more than a quarter of a million members and had become a major influence in the field.

By the 1980s family research skyrocketed, inspired by advocates, propelled by increased federal funding, and guided by new computer technologies. We found that the family paper cited most often was Keith Crnic, William Friedrich, and Mark Greenberg's 1983 *Adaptation of Families with Mentally Retarded Children: A Model of Stress, Coping, and Family Ecology.* This paper provided a conceptual framework for studying families that balanced the negative perspective embedded in the previous three decades of family research with a more positive one. Researchers were encouraged to pay more attention to the positive impact on families of a child with a disability, and advanced a stress and coping model in place of the previous focus on parental psychopathology. In addition, this paper reminded researchers that mothers had, for too long, been the sole focus of family research; some subsequent investigators met this challenge and undertook studies of fathers and siblings. The focus on coping has led other researchers to examine coping processes across cultures.

In a subsequent column I plan to elaborate upon the theme that "culture matters"; here let me just say that recent contributions to the family research literature have helped us to understand the differential impact of a child with disabilities on African-American, Chinese, and Latino families in the United States.

Another family issue that emerged in the 1980s was the parenting of adults with mental retardation. People with disabilities are fully participating in the phenomenon known as the "aging of America." As these people live into their 50s, 60s and beyond, their parents are faced with even longer parenting and an even more pressing need to plan for their adult child's future. Some of these parents face the challenge of parenting well after their own health begins to decline. Yet Marsha Seltzer and Marty Krauss pointed out, in

research reflections

continued from page 47

their 1989 paper *Aging Parents with Adult Mentally Retarded Children: Family Risk Factors and Social Support*, that mothers' well-being was high—as high, in fact, as in mothers considered in the broader gerontology literature who were caring for their own aging parents. One possible explanation for such satisfactory well-being is that co-residence of adults with retardation with their parents has a salubrious effect. Indeed, Tamar Heller, Alison Miller, and Alan Factor noted in a 1997 paper, *Adults With Mental Retardation as Supports to Their Parents: Effects on Parental Caregiving Appraisal*, that "[p]arents who received support from their son or daughter with mental retardation experienced greater caregiving satisfaction and less caregiving burden." Perhaps more than ever before, parents of exceptional people can enjoy their caregiving responsibilities and appreciate their offspring's positive impact.

At the same time that the research spotlight cast a flattering light on parents of children with mental retardation, new players entered the stage—parents who themselves had mental retardation. Although there has been intense attention paid in the past two decades to parents with retardation, this population was actually of interest to researchers as long ago as the 1920s. A particularly forward-looking 1947 paper by Phyllis Mikelson, *The Feebleminded Parent: A Study of 90 Family Cases* examined characteristics of families with at least one child and one parent with mental retardation. This study yielded a bold and prescient finding—that parents with both mental retardation and serious mental health problems were much less likely to provide adequate child care. This foreshadowed today's intense professional and practitioner interest in dual diagnosis of mental retardation and mental disorders, another topic I plan to address in a later column.

Looking back over the 125-year history of the American Association on Mental Retardation and the family research that germinated and finally blossomed during that time, one can see that parents were not pulled, magically, from a seemingly empty hat. Rather, the visibility that parents now have, influencing the focus of research, services, and policy, was hard-earned—it built upon the faith and effort of forward-looking scholars, professionals, and parents. Looking ahead, you, as exceptional parents, are writing the next chapter. EP

Never in my Wildest dreams...

"WHEN I FIRST CAME TO CROTCHED MOUNTAIN OVER 10 YEARS AGO, activities that were second nature prior to the automobile accident were challenging tasks. Today I am a college graduate and also have my drivers license.

Never in my wildest dreams would I have been able to do half of what I've achieved without the encouragement and help that I received at Crotched Mountain! I want to thank everyone at Crotched Mountain for helping me get my life back!"

Universal Newborn Screening

In 1961, Dr. Robert Guthrie of the University of Buffalo developed a laboratory test to detect phenylketonuria (PKU) in newborns. PKU is an inherited metabolic disorder resulting from an enzyme deficiency; if left untreated, it results in profound mental retardation. In 1963 Massachusetts became the first state to mandate screening for PKU, which can be treated by lifelong dietary management and counseling. The National Association for Retarded Children (now The ARC), the Children's Bureau and the Kennedy Foundation were foremost among the organizations that pushed for widespread adoption of the Guthrie test, and by 1966 it was required for all children by all 50 states and the District of Columbia.

Dr. Guthrie and other researchers continued to develop newborn screening (NBS) tests to detect many more disorders, and each state decided what screens would be available for its newborns. Significant disparities resulted; in 1997, in Massachusetts, infants were tested for 10 or more disorders, while Utah's babies were screened for three. Montana and South Dakota each mandated three tests and offered one other by special request only. In the same period, with the introduction of ever-smaller and more powerful microprocessors, technology and equipment became significantly more sophisticated. This permitted testing that had not been feasible before. A process called tandem mass spectrometry (tandem MS, MS/MS) can now run tests for nearly 40 disorders at one time. None are curable, but all are treatable.

In the last two years, many states have expanded their NBS programs. Almost all Pennsylvania hospitals now offer the full spectrum of testing, although the law mandates testing for only six. Massachusetts routinely screens for more than 15 disorders and is running a pilot program offering 30+ tests. Wisconsin has almost tripled availability, from 7 tests to 20. Yet universal NBS still engenders much controversy, and there are many issues to be resolved before consensus can be reached on how the US will move forward.

The data tells us that of the four million babies born in the US each year, ten to twelve thousand may have one or more of these detectable...and treatable...disorders

ISSUES: These may be economic, political, professional, sociocultural, religious. Capital spending, training, payment policies, long-term follow-up; insufficient hard financial data; union issues; professional knowledge levels and practice habits; citizen knowledge, and cultural and religious beliefs and practices; insurance, managed care companies, Medicaid, ChIP programs, the uninsured–all these and many more must be part of discussions and resolution.

With the current system, a child born in Louisiana with galactosemia will likely live a life marked by mental retardation and other special health care needs, while similarly affected children born the same day in most of the rest of the country will receive immediate treatment and become productive members of society. The data tell us that of the four million babies born in the US each year, ten to twelve thousand will have one or more of these detectable disorders, an almost-negligible number. The overall cost or benefit to our society, though, will vary wildly from one child to another because of the patchwork of screening availability. We as a nation must find a way to embrace universal NBS and make it routine for all children born in the US. More than that, it is downright wrong not to do so when it has proven its worth time and again!

It is a question of education and awareness. Research shows that the average couple planning to have children does not know anything about existing screening programs, much less the capabilities offered by tandem MS, largely because OB/GYNs, pediatricians, genetic counselors and related professionals are not familiar with universal NBS. The education gap relates to professionals and consumers, rich and poor, people of every race, religion and ethnicity. Few people know much about any of the issues. Worse, among the people who do profess knowledge of NBS and the issues, a good deal of what they "know" is wrong.

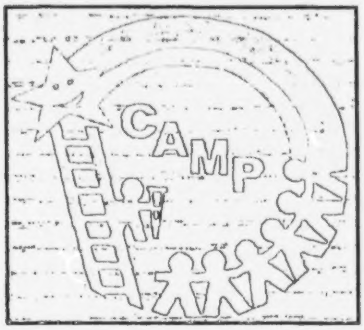
SUMMERTIME SUMMERTIME SUM SUM SUMMERTIME!

Camp C.A.M.P. A Unique Learning Experience

**by Larry McClaugherty, RPh, MPH, FASCP; Lynn Vu, PharmD;
Tracy Virtue, PharmD Candidate;
Sherry Womack, PharmD Candidate**



The Children's Association for Maximum Potential (C.A.M.P.) was founded in 1979 by Dr. Chris Johnson, then a pediatric resident at the United States Air Force Medical Center in San Antonio, TX. Doctor Johnson was inspired to start C.A.M.P. when, one spring, a young boy named Matt came to her for a summer camp physical and returned to her that fall with the sad news that he had been "too handicapped" to attend the camp. It was for children with disabilities, but only for those who were completely self-sufficient. Matt did not fit the criteria because he could not tie his own shoes or fasten his leg braces. It was then that Dr. Johnson decided it was time to push forward a long-time dream of having a camp that accepted all children, regardless of their disability. Now in its 23rd year, Camp C.A.M.P. hosts children from all over the United States. C.A.M.P. is a non-profit organization that puts 92 cents of every dollar donated back into the organization; only 8 percent goes to administrative costs. To make this possible, many people come together and volunteer their time. During any given week at C.A.M.P. there are more than 150 staff members, including counselors and medical volunteers.

A Typical Day at C.A.M.P.

A typical day at C.A.M.P. is long and fun. Everyone starts the day early. Counselors get up, get ready, and then get their campers ready for Flagpole. At Flagpole each tribe (group of campers) gets together and shows its spirit by singing camp songs and cheers. Flagpole starts at 8:00 a.m. and is followed by breakfast at 8:15 a.m. At each meal, medical staff members sit with their assigned tribe and administer medications. Campers have two morning activities, such as horseback riding, swimming, canoeing, archery, and arts and crafts, before lunch. Throughout the day medical staff people participate in activities with their tribes, so that medical help is always available in case of an emergency. After lunch, campers and counselors have a rest period before afternoon activities. Special activities are planned for after dinner, ranging from karaoke to wacky Olympics to dance. Then everyone hits the cabins for showers and bedtime. Once the campers are back in the cabins the medical staff comes for night rounds. At night rounds each camper gets bedtime medication and a brief check-up to address any medical issues that might have arisen during the day. The medical staff talks with counselors about their campers to gain more information and offer suggestions. Around 9:30 p.m. the entire medical staff meets at the infirmary for a night round meeting led by Dr. Chris. Concerns for individual campers are addressed, suggestions and plans of action are made for some, unique accomplishments of campers are discussed, and the events of the day are reviewed. Assignments are made for the medical staff that will be on call that night and the following day.

Specific Disabilities seen at C.A.M.P.

C.A.M.P. is not a typical summer camp. Even though the children participate in the usual camp activities, the standard camper has multiple disabilities. Among the more common at C.A.M.P. are cerebral palsy, muscular dystrophy, spina bifida, autism, mental retardation, Down syndrome, ADD/ADHD and seizure disorders. Campers might also have such rare disorders as fragile X, Wolf-Hirshorn syndrome, tuberous sclerosis or Angelman's syndrome.

For the healthcare provider, C.A.M.P. allows a practical first-hand learning experience with various developmental disabilities. In addition, a developmental disabilities review course is available to all healthcare volunteers and counts as continuing education credits for many of the professionals. The course is offered during the volunteer week at camp and includes five hours each day of didactic classes about each major disability.

Roles and Responsibilities

One of the most impressive aspects of this camp is the amazing leadership and maturity demonstrated by the young people who

C.A.M.P. campers get some advice from their counselor.

serve as counselors and support staff. These young people, many only 15 or 16 years old, are volunteering their time to take care of others. Each counselor is responsible for one camper. They never leave campers' sides during the day and sleep in the beds next to them at night. Counselors get campers ready, make sure they eat and drink, bathe them, play with them, help with toileting, and handle many other tasks. Counselors often find it hard to part with their campers at the end of the week after spending day and night bonding with their new friends! Destiny Waiter, a counselor this summer, has adopted a quote she once heard on the radio as her own personal creed: "Service is the price you pay for the space you occupy." Says Destiny about being at camp, " you can really affect someone's life. When a child with autism tries to bring you into his world, it's the coolest thing!"

A full medical staff is on hand at all times. Doctors, nurses, medical students, pharmacy students, nursing students, speech therapists, physical therapists, and occupational therapists are all present. These disciplines come together to help make C.A.M.P. a safe and enjoyable environment for everyone. Specifically, the role of physicians is to examine all the campers and periodically check their health status. Physicians also help the other members of the medical staff, including the nurses, whose duty is to document and administer medications and treatments as necessary. Pharmacy students may also help in this role and are available to answer questions about medications and their administration. Therapists and social workers are very involved in setting and

Resources for Choosing Camps

AMERICAN CAMPING ASSOCIATION
(800) 428-CAMP
http://www.acacamps.org.
ACA monitors camps in all 50 states to see if they meet 300 standards for health, safety and program quality. Over 2,000 camps, including those with special needs programs, have earned ACA accreditation. The ACA Web site offers informative articles on choosing a camp as well as a database that lets parents do a search for camps using a variety of criteria.

THE EPILEPSY FOUNDATION
(800) 332-4050
http://www.efa.org
Some Epilepsy Foundation affiliates offer summer camping and family retreat programs, whether they run the camps themselves or make arrangements with local camps for a special camping session for children with seizures. In many cases, scholarship money is available through the local affiliate and also through the Epilepsy Foundation's national office for children with seizures to

continued from page 53

keeping track of goals for campers and helping them to build important skills needed for independence. At the end of the week all campers who have met their goal receive a ribbon recognizing their progress. Goals for some campers were broad, such as socializing with other children; or experiencing an activity they have never tried before. Others had more specific goals such as learning how to shake hands, for example, or tie shoelaces. The McConleys brought their daughter, Kaly, to camp this summer hoping that she would meet their goal for her of learn the meaning of the word "vacation." To aid Kaly in the process, a physical therapist at camp made miniature flash cards using pictures associated the camp activities. The therapist used the pictures to represent vacation in such a way that Kaly could make the connection that she was on vacation. At the end of the week, Kaly met her goal when she proudly announced, " VACATION IS FUN!" Commenting on how proud and happy the parents are when they find out their child has met a new goal, occupational therapist Shana Scheib said, "You get to see what camp does for the parents."

Interdisciplinary Approach

The lines between nurse, doctor, and pharmacist are not clear at C.A.M.P. Professionals play a definite part but also step outside their traditional roles. Every discipline brings something unique to the team and that knowledge is shared to benefit everyone. Each person on the medical term leaves C.A.M.P.

continued on page 56

attend the camp of their choice. Contact the Epilepsy Foundation for your local affiliate. The Foundation's Web site also has articles on camping and sells brochures both for parents and for camp counselors on camping for children with seizure disorders.

UNITED CEREBRAL PALSY
(800) 872-5827
http://www.ucpa.org/
Some UCP affiliates offer camping experiences. Contact your local UCP affiliate for more information.

MUSCULAR DYSTROPHY ASSOCIATION.
(800) 572-1717

with a better understanding of fellow health care professionals and a true understanding of " interdisciplinary teamwork."

Something for everyone

For the parents, C.A.M.P. allows much-needed respite. Janet Troy from Houston said, "I was happy that our daughter, Autumn, got individual attention from a counselor around her age. It's nice that she gets to spend time with other children with similar problems while her father and I got to enjoy a little time alone."

Campers have one counselor each who is always by their side.

Part of the reason C.A.M.P. is such a big success is that everyone working there is so dedicated. "This is my fifteenth summer at C.A.M.P. I consider C.A.M.P. my family," said Cat Hadovsky, the assistant camp director. "I like to see the campers learn and have fun they normally wouldn't have and get one-on-one attention they might not get anywhere else. I also like to see the teenage counselors blossom as young people. People may say negative things about teenagers today but give them a purpose like C.A.M.P. and you can really see them shine."

Many of the volunteers do not view C.A.M.P. as work but instead feel it is a privilege, and they also feel a sense of pride for giving so unselfishly of themselves. Ben Johnson, a counselor for the past four years said, "You know that you can help so many people and get so much out of it yourself. I think all the counselors would agree with me when I say that the reason I come back is to see the smiles on the campers' faces and knowing that we're helping to make them happy." EP

Larry McClaugherty, RPh, MPH, FASCP, is the parent of a son with special needs who attended Camp C.A.M.P. and a Preceptor for the University of Houston College of Pharmacy, TX. Lynn Vu, PharmD, Tracy Virtue, PharmD Candidate, Sherry Womack, PharmD Candidate, of the University of Houston College of Pharmacy, TX, particpated in C.A.M.P. as part of the interdisciplinary medical team.

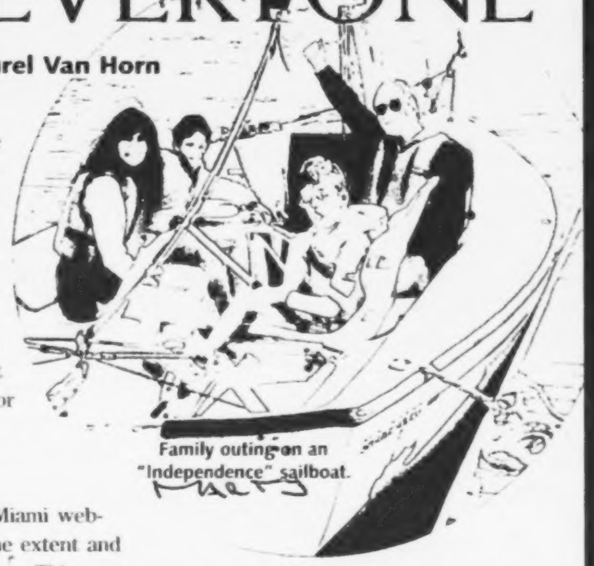
SHAKE-A-LEG MIAMI
SAILING FOR EVERYONE

Article and photos by Laurel Van Horn



Family outing on an "Independence" sailboat.

I had read about the Access Dinghies from Australia that made sailing possible for virtually anyone and even met Graeme Raynor, their "Johnny Appleseed," but seeing them in action last January was a real thrill. Shake-A-Leg Miami now has 14 of these colorful, little boats, which can even be sailed with a joystick. Every Sunday afternoon kids of all ages, sizes and abilities converge on the facility in Coconut Grove for basic instruction and a recreational sail. What makes this program so great is that the kids are able to take to the water on their own, guiding the dinghies themselves within the protected waters of the marina. The smaller children, including a set of twins, were sailing in pairs; the older ones, single-handed. Afterward, they all pitched in to wash the dinghies and put away equipment, an integral part of the sailing experience. For some, this could be the start of a lifelong love of sailing. Shake-A-Leg has a variety of programs these youngsters can graduate to, including competitive sailing in local regattas. And there's a whole fleet of larger boats for them to grow into at this universally accessible watersports facility. At present there are eight 20-foot "Independence" sailboats designed for wheelchair users, as well as three 23-foot "Sonar" sailboats, the type most commonly used worldwide for disabled sailing competitions.

SHAKE-A-LEG'S HISTORY

If you visit the Shake-A-Leg Miami website, you will be amazed at the extent and inclusiveness of their programs. This was not achieved overnight, of course. Harry Horgan, founder and executive director, began the original Shake-A-Leg in Newport, Rhode Island in 1982 following an accident which left him paralyzed. A lifelong sailor, he teamed up with a naval architect and yacht manufacturer to design a boat that would be universally accessible. Now known as "Independence" sailboats, these watercraft cannot sink or capsize and have two special seats, with all lines running into the cockpit. With a capacity of six, they're also very family friendly.

In 1990 Shake-A-Leg expanded its operation to Miami, where initially it catered only to adults with physical disabilities. The center then decided to reach out to children with disabilities, before opening its doors also to "at risk" youth. Along the way public-private partnerships developed, so that Shake-A-Leg Miami now operates in conjunction with the

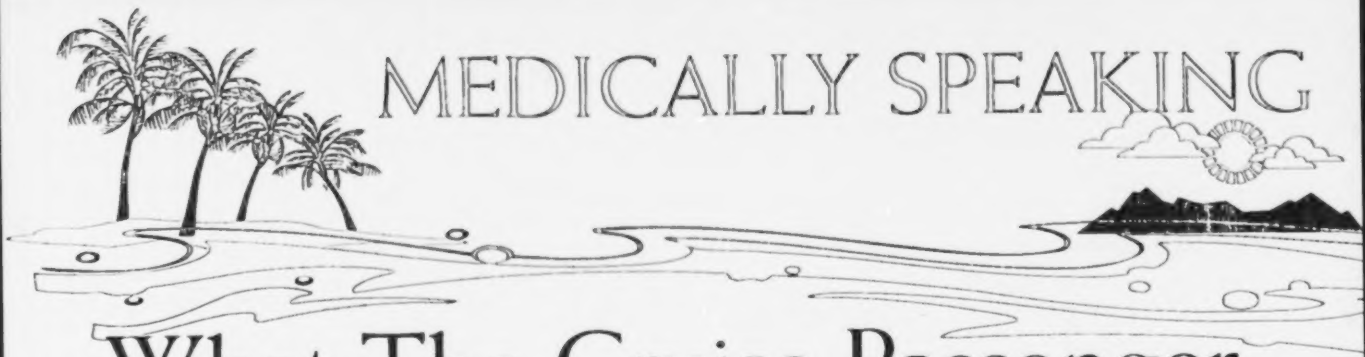
Access Dinghies in the Miami waters.



What The Cruise Passenger SHOULD KNOW

By Linda Allen, MA, MCC

Cruise passengers may or may not come on board prepared for their cruise. Some embark with little or no forethought to the situations they may encounter. Even passengers with complicated medical conditions may book a cruise with the thought, "There is a doctor and hospital onboard so they can take care of me if I need attention while at sea." These same people may board the ship with medications removed from their original containers and with little or no written medical history. Piecing together a complicated jig saw of medical needs with limited resources can strain the medical facilities of any vessel and cause great anxiety for the patient.

In an attempt to provide cruisers with the medical information they need before boarding, we offer the following suggestions.

KNOW BEFORE YOU GO

Too often, the lure of a beautiful brochure showing exotic destinations is all that a cruise passenger sees, while the section at the end is disregarded. This section, which outlines the terms of the contract between the cruise line and the cruise passenger, is written in simple and straightforward language. Even the more detailed cruise contract that is delivered with every set of cruise tickets can be easily understood by most passengers. The problem lies in getting them to understand that they are in fact entering into a contract with the cruise line. With the exchange of money, the passenger as well as the cruise line assumes distinct obligations.

Most cruise contracts specify that the cruise line must be notified of any medical condition that can impact the health and safety of the passenger or make them unfit to travel. This includes pregnancy, which some passengers see as a non-medical condition. In fact fitness to travel is such an important area within the cruise contract that it is one reason a passenger can be denied boarding at the embarkation port. It can also necessitate emergency disembarkation en route.

DO YOUR RESEARCH

Do a bit of research about the destination to determine if any special medical precautions are needed. Even better, consult your physician or a travel medicine specialist 6 to 8 weeks before your trip. A physician familiar with travel medicine will address concerns that include not only your current state of health but also any needed immunizations, health precautions, or medications that should be added to your first aid kit.

Plan for the weather and terrain. Make sure that you pack appropriate clothing for any expected circumstance and sensible shoes for your destination.

Keep abreast of the political climate and any unrest in the area you will be visiting. Pay attention to any advisories that are placed in the ship's newsletter about the ports of call.

HOW TO CHOOSE THE RIGHT SHIP

The passenger with physical disabilities or medical concerns should carefully select a travel consultant to assist them with their cruise plans. The tried and true methods of asking friends, family and members of support groups are still the best ways to find a qualified agent. It is less important to find

SATH-Breaking Down Barriers To Travel

Since 1976, the non-profit Society for Accessible Travel & Hospitality (SATH) has been raising awareness of the needs of all travelers with disabilities, and removing physical and attitudinal barriers to travel both in the US and abroad. Members include consumers with disabilities, travel professionals, and other individuals and corporations who support SATH's mission. For more information, contact SATH at 347 Fifth Ave., Ste. 610, New York, NY 10016; phone: (212) 447-7284; fax: (212) 725-8253; e-mail: sathtravel@aol.com. SATH's Web site http://www.sath.org contains a wealth of travel-related information, some of which includes fact sheets on travel with different disabilities; selected feature articles from *OPEN WORLD magazine*, SATH's quarterly magazine; and travel and access information with lists of publications, government resources, disability travel Web sites; accessible transportation rental agencies and a directory of travel and tour operators specializing in travel for people dealing with specific disabilities. EP wishes to thank SATH and Laurel Van Horn, executive director of SATH and editor of *OPEN WORLD*, for contributing these two articles.

continued from page 59

someone who is a specialist in dealing with disabilities than to find someone who is excellent at their profession. Their skills and experience with their suppliers will allow them to meet your needs effectively. First and foremost, make sure that your agent is someone you enjoy talking to, feel comfortable with and trust. Experienced, qualified agents will often have the credentials of MCC or CTC after their name. The MCC designation signifies that the agent has met the requirements of CLIA (Cruise Line International Association) to be designated a Master Cruise Counselor. The trade industry has a broader training program for full service agents or cruise only agents which earns them the title of Certified Travel Counselor. Either of these designations indicate that the agent has invested a great deal of time, effort and money in making sure that they can serve clients effectively.

With the help of your agent you can then begin the process of selecting the correct ship for you. It is wise to plan as far in advance as possible to ensure that you are able to get the ship and itinerary that is of greatest interest to you. If you require a special wheelchair accessible cabin you should plan on reserving about a year in advance. This is especially true if you want a suite or an inexpensive inside cabin, as these are the first to sell on modern ships. There are very few wheelchair accessible suites in the market so make sure you discuss the type of cabin that you want early in your discussions with your agent.

> Refunds when given for unforeseen covered expenses are paid by insurance companies and not by the cruise line.

A good rule of thumb to discuss with your agent is that the newer cruise ships are generally the most disability friendly. The cruise lines voluntarily strive for compliance with the guidelines of the Americans with Disabilities Act and many of them offer some of the most barrier-free accommodations in the travel industry. The new ships also are larger and able to afford more space for the medical facility. It is also a good idea to ask if the ship is marketed primarily to the North American market. These ships will have English speaking medical personnel and will meet the expectations of the North American passenger. Don't forget to confirm that the cruise line is a member of ICCL-International Council of Cruise Lines.

Once you have narrowed down the field of possible ships, dates and itineraries, it is time to start looking at the ports of call. It is not a good idea to choose an itinerary with tender calls if you have mobility concerns. Tenders are much smaller boats that are used to shuttle passengers from the cruise ship to the shore. Most require the use of stairs or at the very least a transfer from the relatively stable cruise ship to a bobbing tender. Try to pick an itinerary where the ship docks at all or most of the ports.

Purchase Travel Insurance

Many passengers feel that if they have an unusual or tragic event in their lives that prevents them from travel that the cruise line should offer them a full refund. Refunds when given for unforeseen covered expenses are paid by insurance companies and not by the cruise line. Therefore, passengers who must cancel a cruise due to circumstances such as illness or death of a family member will not be reimbursed without travel insurance. The penalties accessed by each cruise line are clearly spelled out in every full cruise brochure. If a passenger purchases a cruise without a full cruise line brochure, they should ask for one before final payment is due so that they can read the terms and stipulations for themselves before they are in the penalty point range.

The purchase of travel insurance does so much more than protect the purchase price of a cruise. In addition comprehensive travel insurance policies offer such peace of mind

With the Creepster Crawler, You Can Watch Your Child Crawl for the First Time!

Children lacking head control, the ability to roll over or belly crawl have gained mobility with the ***Creepster Crawler.*** Using this light, innovative device, hundreds of children around the world are crawling, working more productively with their therapists, and gaining a head start to more advanced mobility in the future.

The ***Creepster Crawler*** is an ideal solution for youngsters with debilitating conditions such as ☐ Spina Bifida ☐ Down Syndrome ☐ Cerebral Palsy ☐ TBI, and ☐ developmental delays. Children with tracheostomies and G-Tubes also are successful users of the ***Creepster Crawler***.

The ***Creepster Crawler***'s frame has a padded platform that can support a parent or therapist from above, making it easier to work with the child on weight-bearing, weight-shifting, reaching and creeping. Front shoulder, chest and rear straps can be adjusted for individual fit.

Please visit our Worldwide Web site at www.red-enter.com for additional details and a video demonstration of the ***Creepster Crawler***.

items as medical evacuation, travel accident or illness coverage, return of mortal remains and travel assistance. Travel insurance can be purchased directly through the cruise line or through a travel agent. Any policy that is purchased should cover pre-existing conditions as well as default of suppliers or carriers. Even when a major cruise line with great financial stability is involved, air carriers or others who are responsible for part of your vacation may be affected by such things as strikes and natural disasters, making them unable to provide the contracted service.

NOTIFY OF SPECIAL REQUESTS

Most cruise lines have the ability to accommodate a large number of special requests: such things as cribs in a stateroom, special diets and wheelchair accessible cabins. Some lines have special equipment available for hearing and sight-impaired guests, but guests need to request this ahead of time due to limited supply. All of these things should be reported by the passenger to the travel agent, who can then direct the special request to the correct department within the cruise line. This should be done at the time of the original booking.

Even clients who do not require an adapted cabin but who use a wheelchair, walker or cane full or part-time should report this to the agent so that the cruise line can be notified. This assists in priority embarkation and disembarkation as well as convenient placement in the dining rooms. Physically challenged passengers should be placed as close to an elevator as possible and every effort should be made to place them near their dining room.

If there are any medical, physical or dietary conditions including but not limited to the following, report them at time of booking: Mobility Impairment, Vision or Hearing Impairment, Pregnancy, Allergies, Diabetes, Dialysis, Oxygen Use, Bleeding Disorders, Injectable Medication, Prescription Medications, and Dietary Requirements.

WHAT TO TAKE ALONG

Each passenger should have the name and phone numbers for his primary and specialist physicians. Also please carry with you in your carry-on luggage a copy of your latest medical records with such information as recent EKG,

medications list and allergies. A medical information sheet with next of kin, hospital and health and travel insurance information is also helpful. Also place in your carry on luggage your medications and spare eyeglasses or contacts and a small first aid kit. If you have a medical condition and you do not have a Medic Alert neck tag or bracelet, this would be a good time to purchase one and wear it. (Call Medic Alerts at 1-800-825-3785). It is also a good idea to have your travel agent's non-800 number if you are going to be out of the United States and need to call them.

WHAT TO LEAVE BEHIND

For your peace of mind make sure that you leave the following information behind for your friends and family: the name of the ship you as well as your flight information, your cabin number and reservation number, your travel agent's name and phone number and a photocopy of the first page of your passport. In your cruise documents you should find information for ship to shore phone numbers and the fax number to the ship. Do keep in mind that ships often can only receive faxes when they are at sea. In this case a copy of the ship's itinerary would be very helpful.

MEDICAL FACILITIES ABOARD SHIP

Many modern cruise ships come under the umbrella of the ICCL, which with the assistance of the American College of Emergency Physicians' section of Cruise Ship and Maritime Medicine, has developed a set of guidelines for the medical facilities on cruise ships. Their member lines have voluntarily agreed to support these guidelines. One of your questions as a passenger should be: "Is the cruise line I am considering a member of ICCL?" If not, you should investigate their medical capabilities before entrusting your well-being to them.

Medicare does NOT reimburse subscribers for medical care rendered on board ships unless the vessel is registered and flagged in the United States.

In the medical facility you will find one or more doctors along with highly skilled nurses. These dedicated professionals provide 24-hour coverage for health care needs. They have set office hours as well as a pager for instant notification of an emergency or urgent medical need. Please keep in mind that medical care is at the passenger's expense and that insurance assignment is rarely accepted on or off the ship. U.S.

Medicare does NOT reimburse subscribers for medical care rendered on board ships unless the vessel is registered and flagged in the United States.

Some facilities are state of the art and provide such things as telemedicine, digital X-rays and sophisticated laboratory diagnostics. But in all of them you will find basic life saving drugs and equipment for stabilization. When you are comparing a ship-based medical facility with a land-based one, it is important to remember that it is much more akin to a free-standing urgent care center than to a hospital. The shipboard medical facility does not have the luxuries of onboard specialists, large nursing staffs to offer 24-hour extended care, or highly specialized tests such as CAT scans. For these reasons if a patient requires ongoing medical care, it will be necessary for them to disembark at the first appropriate port of call for either care there or emergency air evacuation to an appropriate medical facility. Since any air evacuation will require several thousand dollars, it is imperative that passengers have insurance for this unexpected event.

LIFE BOAT DRILLS

Experienced as well as first time cruisers all too often endure lifeboat drills with only cursory attention. Saving your life in the rare event of a disaster will be up to you as well as the staff. Know the ways to your life boat station and what items to carry with you. Don't count on someone being at every turn to direct you; assume responsibility for your safety any time you set foot on a ship.

PREPARE AHEAD AND ENJOY YOUR CRUISE

Over 5 million Americans will cruise this year and only about 5% of them will seek medical attention from the ship's medical facility. The vast majority of the problems encountered will be minor and easily treated aboard ship. A few passengers, however, will suffer serious illness or injury that will require emergency treatment in the ship's medical facility and then medical evacuation to a shoreside hospital. In the unlikely event that you will require emergency treatment and/or evacuation, being properly prepared to assist the medical personnel with your history, emergency contact and travel insurance information will make your experience much less stressful. ■

R.E.A.L. Design Introduces VIVO™
The New Multi-Therapy Pony

Children will love VIVO, the playful, spirited little pony with the head that bounces when moved and a colorful beaded tail. Parents and therapists will appreciate the valuable skills children gain by playing on VIVO because it functions as a balance rocker or gait trainer by simply interchanging the legs which snap on and off easily. As a rocking horse, VIVO promotes balance reaction skills and upper body postural development. As a gait trainer, it provides incentive for a child to learn ambulation skills. The soft upholstered seat back, with molded laterals, is height adjustable to position children comfortably and securely for rocking or learning to walk. Accessories are available for adapting VIVO to a child's positioning needs.

HYPERBARIC OXYGEN THERAPY
In the Treatment of Brain Injury

REPORT OF A MEETING

On July 25-28, 2001, a meeting was held in which clinicians, clinical investigators and family members reviewed the present status of information about the use of hyperbaric oxygen therapy (HBOT) in the treatment of brain injury. Nearly all participants in the meeting were advocates of the use of HBOT; there were no presentations by conferees who were either opposed to the use of the therapy for this purpose or whose position was as yet undecided. One of the major topics of discussion was the recent report of the "Montreal trial" that demonstrated significant functional improvement in many of the cerebral palsy children participating in the randomized double-blind HBOT trial, but with no differences in functional outcomes in children treated either with 1.35 ATA of air or 1.75 ATA of 100% oxygen (see Research Fact Sheet: Hyperbaric Oxygen Therapy (HBO) for Children with Cerebral Palsy: Report of a Clinical Trial).

The conferees participated in two broad areas of discussion: (1) reports of clinical experiences that appeared to preserve life and restore impaired function when HBOT was administered soon after brain injury (e.g. traumatic brain injury; drowning; birth hypoxia; meningitis); and (2) the clinical experience that HBOT appeared to restore function in persons (usually children) with disabilities following brain injury at sometime in the past (e.g. cerebral palsy).

At this meeting, the principal presentations were reports of clinical experience utilizing HBOT, either individual cases or case series. The reports described functional improvement in both the acute and chronic situations following brain injury. In the chronic situation (cerebral palsy), the results of the use of 100% oxygen administered at a variety of atmospheric pressures were discussed (1.75 ATA; 1.5 ATA; 1.35 ATA); all were reported to be associated with positive short term and long term results; no reports were presented that described poor results. The recognized danger of hyperbaric oxygen was discussed (i.e. seizures), as were the less well recognized behavioral manifestations of oxygen toxicity (e.g. agitation; aggressiveness). In the experience of the conferees, it appears that these complications are unusual, but when they do occur they are manageable by the termination of therapy and the use later of lower levels of hyperbaric oxygen.

One focused item of conference discussion was the Montreal trial and the "implication" that the control subjects receiving air at 1.35 ATA were receiving a "placebo" (a non-therapeutic intervention). It was stated by clinical participants at the conference that air at 1.35 ATA increased both the oxygen level of red blood cells and caused oxygen in the air to dissolve in the blood's fluid (plasma); both increased the availability of oxygen to body tissues—including the brain.

It was proposed by several conferees that the control group of the subjects in the Montreal study were also receiving an increased oxygen supply to the brain; thus explaining the similar clinical improvement in both segments of the study population. If this is true, should air administered at 1.35 ATA be used instead of HBOT? The question was asked, but not answered.

In support of the effects of HBOT on the brain, a number of brain imaging studies using SPECT before and after treatment were presented. SPECT provides images of regional cerebral blood flow; by inference, a change in blood flow implies but does not demonstrate a change in cerebral metabolism. In all of the cases presented, SPECT showed increase in cerebral blood flow in a variety of poorly perfused areas of the brain following HBOT. It was hypothesized that these areas of increased blood flow were metabolically more active than prior to HBOT.

COMMENT:

The reports presented at this meeting of improved function and cerebral circulation cannot be disregarded by labeling them as "observations by biased advocates". These observations by skilled clinicians and parents need to be explored by appropriate scientific studies that meet the standards of modern research. One study, the Montreal study, clearly indicates that room air delivered at a low level of increased atmospheric pressure (1.35 ATA) gives identical results to 100% oxygen delivered at increased pressure (1.75 ATA). At this time, there is still no scientifically acceptable evidence that HBOT is useful in the treatment of disabilities associated with cerebral palsy. The following questions remain to be answered:

- Is HBOT (oxygen level? pressure level?) useful in the treatment of disabilities associated with cerebral palsy?
- Is hyperbaria alone (pressure level?) useful in the treatment of disabilities associated with cerebral palsy?
- Is oxygen supplementation alone (oxygen level?) useful in the treatment of disabilities associated with cerebral palsy?

Sufficient clinical experience does exist to support the need for additional controlled studies exploring these questions in a scientifically acceptable manner (i.e. randomized, double-blind trials). Air delivered in a hyperbaric chamber at 1.0 ATA can serve as a control.

Another issue also requires study: the suggestion that there are "idling" neurones in the brain years after injury that become active after the use of HBOT. At this time, there is no evidence that this is true. However, there are methods available to test this hypothesis: PET brain imaging or metabolic magnetic imaging. These quantitative methods of measuring focal brain metabolism can be applied before and after HBOT and will answer the question.

Are the above studies do-able? They are. To be successful they must have the active participation of the children to be studied, their caregivers, clinicians, and scientists. They also require the organizational arrangements and financial resources that these studies demand in order to be successful. The UCP Research & Educational Foundation is attempting to see if the necessary personnel, the organizational and the financial requirements can be mobilized to initiate these needed studies to evaluate the usefulness of HBOT in treating children with disabilities due to cerebral palsy. Taking The Next Step Together

Moving forward... a new location... a whole-hearted vision

THE THIRD ANNUAL WORLD CONGRESS & EXPOSITION ON DISABILITIES

SHOW DATES:
Thursday, Friday & Saturday—October 3 - 5, 2002
LOCATION:
Orange County Convention Center—Orlando, Florida

A UNIQUE GATHERING—A Disability Conference and Trade Forum, bringing together families and professionals all under one roof. Orlando, one of the world's most popular vacation destinations, is the perfect setting for this coming together. The WCD will attract **physicians ○ families ○ direct support professionals ○ people with disabilities ○ allied health care professionals ○ educators ○ adapted physical education specialists.**

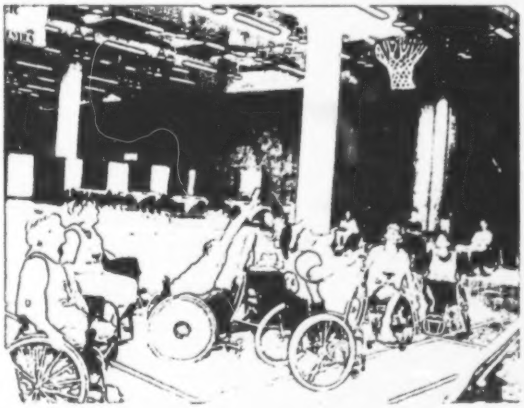
TRADE SHOW: Meet with over 250 exhibitors including product & service providers, organizations, manufacturers, retailers, home medical equipment dealers, distributors, long term care, rehabilitation and extended care facilities.

SPECIAL FEATURES

SPORTS & RECREATION ACTIVITY CENTER: Features top athletes with disabilities in basketball, tennis, rugby, soccer, track and field and more.

EMPLOYMENT SYMPOSIUM PAVILION: Human resource managers will discuss career opportunities.

FAMILY, PROFESSIONAL AND GOVERNMENT ORGANIZATIONS: Meet with over 30 national and regional organizations, non-profit associations and professional societies.



CONFERENCE PROGRAM: Comprehensive, multi-disciplinary approach to education. Seminars will focus on medicine, education, family issues, advocacy, assistive technology, adapted physical education and career/employment.

- All WCD attendees can experience discussions by internationally renowned experts specializing in neurology, orthopedics, pediatrics, internal medicine, family medicine, physical medicine, epidemiology, DDS, movement disorders, mitochondrial and metabolic disorders, neonatology, seizure disorders, autism, and other disabilities and chronic conditions as well as general practitioners.
- CME and CEU accreditation will be provided through approved accreditation institutions.
- Hear parents and professionals share strategies and techniques for planning and problem-solving in the home, the family, the community and the world at large.
- An Employment Symposium produced in conjunction with the Florida Department of Education, Division of Vocational Rehabilitation Services will offer sessions for people with disabilities, their families and employers.
- Learn from special education professionals what is going on in classroom environments.
- Participate in adapted physical education activities and seminars.

WORLD CONGRESS & EXPOSITION ON DISABILITIES
WCD

October 3-5, 2002 ○ WORLD CONGRESS & EXPOSITION ON DISABILITIES

Sigma-Tau Pharmaceuticals

Pairing Scientific Research with Compassion

Sigma-Tau Pharmaceuticals, Inc. has proudly agreed to participate in the 2002 World Congress & Exposition on Disabilities as a gold sponsor. We feel that this sponsorship is one of many examples of Sigma-Tau's adage that no patient should ever be overlooked, no matter how rare his or her disorder.

Sigma-Tau Pharmaceuticals specializes in treatments for rare disorders and underserved medical needs through its manufacture of orphan drugs—medications with treatment populations of fewer than 200,000 patients.

Orphan drugs generally aren't highly profitable. Most are a break-even business opportunity at best. Their discovery in most cases, won't cause stock prices to skyrocket. However, orphan drugs do save lives and improve the lives of people with these rare conditions. They can make life worth living for people with diseases few people recognize.

Sigma-Tau devotes up to 20% of its revenue—a rate that exceeds the industry average—to clinical research in the U.S. and Europe. Sigma-Tau Pharmaceuticals produces Carnitor® (levocarnitine), a prescription form of levocarnitine available for the treatment of carnitine deficiency in metabolic disorders. Carnitor Injection is the only FDA approved treatment for carnitine deficiency in End Stage Renal Disease patients. Levocarnitine is a natural occurring amino acid derivative that helps the body convert food into energy, the process called metabolism. We get most of the carnitine we need—about 75%—from the foods we eat, especially from red meat and dairy products; we produce the remaining 25% ourselves. Levocarnitine works by carrying fats and other nutrients to structures within our cells, called mitochondria, and by clearing toxic waste from those cells. Without enough levocarnitine, our cells become starved of the nutrients they need to function properly and become overloaded with toxic waste. The results can be devastating. For some patients, carnitine deficiency can be life threatening. Several factors can cause carnitine deficiency: genetic defects, poor diet, or even the treatments for certain other disorders, including epilepsy treatments and kidney dialysis.

In addition to educating physicians, families and patients about Carnitor, Sigma-Tau Pharmaceuticals is an active participant in its community. As a member of the Community Volunteer Corporation of Montgomery County, Maryland, the company enjoys organizing and participating in events such as Christmas in April, supporting local food shelters and families, and Toys for Tots. "The employees at Sigma-Tau Pharmaceuticals realize the importance of giving back to our community and that not everyone is as fortunate as we are," says Justina Lambert, Vice President of Corporate Affairs.

For more information on Sigma-Tau Pharmaceuticals or Carnitor, please visit their Web site www.sigmatau.com or call 1-800-447-0169.

SARAH SYNDROME:

A Mother's View of Having a Child with No Diagnosis

by Jennifer Frost

Despite the more than 6000 known rare diseases, it is still common to hear from parents that their child is either "yet to be diagnosed" or has "no known diagnosis." There is a difference, of course, and it has nothing to do with the diagnostic acumen of the attending clinicians.

For many parents, hearing "what their child has" is the beginning and the end—the end of their turmoil, their hunt, their fears and their hope. But for many, the definitive diagnosis demarcates the beginning. They hunt for the noted researchers, clinics, schools, treatments, support groups, and publications about fragile X, Down syndrome, Edwards syndrome, or cri du chat. But the issuance or utterance of a "diagnosis" can also throw the parents into an abyss. The "diagnosis" of cerebral palsy, autism or developmental delay can require a Herculean effort to sort through the spectrum, horizons, borders, variants and atypicalities these conditions represent.

SARAH AND HER MOM

For the parents of children with an unspecified diagnosis there are no expectations. With no expectations, a new and evolving partnership can flourish, a partnership between the parents and the professionals not unlike a person with blindness and the guide dog. They are analogous because the parents and the professionals take turns in wearing the harness and playing the guide. Together they can navigate to a distant point without the often-complicating array of facts and case studies available in "unquestioning conditions."

EP Magazine receives thousands of letters each year from parents "wanting to know" or asking "does anyone else have a child with what my kid has?" The need to belong is so strong in our psyches that even in the realm of disabilities our desire to connect is powerful. Anthropologists know the power of tribe, clan and community and refer to it as "social cohesion."

Parents of children with special needs, regardless of the name or namelessness of their condition, share so much, providing an instantaneous bond among them. When it comes to sharing information, experiences, tips and dead-ends, the one common criterion that seems to make the most impact is: Patient presents with a couple of exceptional parents in tow.

—Rick Rader, MD, Editor-in-Chief

We were a young married couple who just wanted to share their love with children. After two years, we had our first daughter, Hannah. She was perfect in every way, normal and healthy. On April 20, 1999, just 17 months later, our second child, Sarah Elizabeth, was born. We had no reason to believe that she wouldn't be every bit as perfect as Hannah.

I was admitted to the hospital the night before for an induction because of a low level of amniotic fluid. Things happened fast and I knew something was wrong. It was too late for a caesarean section and Sarah was born OT ("occiput transverse," or face sideways instead of face down) with the aid of an episiotomy and vacuum extraction. I had no idea at the time how dangerous this was, nor were these dangers conveyed to me. Sarah received a small amount of oxygen and some X-rays of the extensive bruising, but after an extra day in the hospital, we went home together. There was no way of knowing that the damage was already done.

As a second-time mother with a background in early childhood development, I knew within weeks that something was wrong. Sarah never wanted to be held, not even for comfort. She had poor sucking reflex that, at the time, appeared to be just a "slow start." She held her head to only one side and kept her body tightly rolled into a ball. Within the first few months, doctors discovered that she had bladder reflux, and began preventive antibiotics that she continues today. Unfortunately, this didn't explain her lack of development.

When Sarah was five months old, her pediatrician referred us to a pediatric neurologist, a pediatric ophthalmologist, and to the Siskin Children's Institute for Therapy and Family Training. It was at this time I was introduced to TEIS (Tennessee Early Intervention System.) TEIS is a state-funded early intervention program for children of any economic status with special needs.

During her first assessment under TEIS and Siskin, we learned that Sarah had global developmental delay. It did not come as a surprise, because at seven months old, she could not roll from side to side, hold her head up or do anything else that a baby of that age could do. She had a normal cry, but did not coo or babble at all. Sarah immediately began weekly therapy and we had family training sessions at Siskin.

We remained at Siskin for the next two years. While we are very thankful for the treatment she received there, this past June we chose to discontinue family training. I was not prepared to put Sarah in a school program, so Sarah continued her physical therapy at our area Children's Hospital.

Sarah's first appointment with her neurologist carried many surprises. His evaluation revealed hypotonia and very poor underdeveloped reflexes, but he wasn't sure why. An MRI of her brain and cervical spine were clear. Blood and urine tests were performed to rule out metabolic and chromosomal disorders, diseases or syndromes. All tests were negative, which was great news. However, we still had no answers. Her traumatic birth was always mentioned, but not considered much. The doctors seemed to think that Sarah could have been very ill at birth, and that her significant health problems are birth-related.

After several follow up visits, her neurologist began to change his opinion. He said that there is a handful of kids out there with developmental delay and no diagnosis. He

EP selects "parent editorials" for the purpose of providing a forum for emerging opinions and evolving parenting philosophies. EP also welcomes responses to previous editorials that represent divergent views. These select editorials do not necessarily reflect the opinion of EP. — Rick Rader, MD, Editor-in-Chief

Parents may send their submissions for Parent Perspective to Exceptional Parent Magazine, 65 E. Route 4, River Edge, NJ 07661; e-mail: epedit@aol.com. All submissions are subject to review and editing by EP.

368

went on to say that these kids can fit under the large umbrella of CP, but he preferred not to classify Sarah under cerebral palsy just because we needed a diagnosis. The general opinion is that Sarah had a bleed deep in her brain during delivery, but we don't know where and we don't know what to expect. Sarah continues to see her neurologist once a year for monitoring, but there's just nothing he can do for her.

Sarah is now 2 years old, but still cannot get into a full sitting position. She can only sit for short periods of time without falling. She cannot crawl, stand, walk or talk. Sarah has just received her first wheelchair, and we hope to receive her first power wheelchair soon. What a world there is for her to see! Until now, she pivoted and rolled to move around. Sarah has also begun an assistive technology program that we hope will improve her ability to communicate. She is thriving and learning like never before and we are very excited about her future.

There have been lots of tears and sleepless nights, uncertainties and immeasurable heartache. Yet nothing can equal the joy that Sarah has brought to my life. Her smile speaks volumes and her eyes lead my heart. I can honestly say that she touches the lives of everyone she meets. To know her is to love her. Although she may not be "normal," she is certainly perfect, and worthy of every effort to improve her quality of life. When I tire of the endless rounds of doctors, therapists, hospitals, schools and tests, I remember that Sarah and I are not alone. There are thousands of children with special needs all over the world and each one of them is worthy of the efforts that parents, caregivers, doctors, researchers, therapists, schools, hospitals and legislatures can make to improve their lives.

It doesn't matter that I cannot join a support group for a specific syndrome, or join a national organization for diseases or disorders. In the end, whether a child with special needs has a diagnosis or not, the challenges are the same. As parents or caregivers of these children, it is important for us to remember that they are gifts from God. All have a purpose and a plan in His will. My faith has definitely been tested, but my trust and hope remain in God. I feel that it is my greatest duty in life to be a mother, and I am honored that God gave me Hannah and Sarah.

As a parent, I would like to suggest this for professionals:

- Don't try to have all the answers; no one has all the answers;
- Prepare parents with honesty, not hope;
- Expect a broad range of emotions;
- Care enough to be informed about the special needs community;
- Listen to what the parent is saying and understand that you don't know how the parent feels. EP

Jennifer Frost and her family make their home in Sales Creek, Tennessee.

Your Family's Freedom is Here:

The Rear Entry Kneelvan.

The whole family fits: Kneelvan seats up to 7 people.
Scooters and chairs that won't fit in other vans can fit in a Kneelvan.
KneelVan
Kneelvan is the most reliable lowered floor minivan ever.
More ground clearance than any other lowered floor minivan.
Kneelvan's rear entry design can park anywhere, even in regular parking spots.

Designed with your family in mind, the **Kneelvan is simply the easiest way to travel**. Unlike side-entry conversions, we designed the rear entry KneelVan so you can **never get blocked by someone parking next to you**. Kneelvan is perfect for families with kids: its the best family van ever.

We would like to invite you to compare Kneelvan for yourself. Call today for more information and our free video.

Call Toll Free: 1-888-625-6335.

familiar faces

SHELBY ANN

Pictured is **Shelby Ann Maloy**,9, and her Elmos. Shelby has lissencephaly syndrome and seizures. She attends physical and occupational therapy. She loves her big sister Kelsey, who is 14 years old. Shelby lives with her parents, James and Trish.

ADAM

Adam J. Gunhammer, 6, is a special boy. He gets around with a wheelchair and his walker. He loves musical toys, going to school, eating, and his grandmother, who spends a lot of time with him. They work on little projects together every day. She is very proud of him.

SCOTTY

Scotty Jones, 10, enjoys cartoons, noisy toys, and his puppy Angus. Scotty has cerebral palsy as a result of shaken baby syndrome. He is non-verbal and non-ambulatory. He helps out with Toys for Tots every year.

JOSE

Jose M. Navarro, 2, loves to stroll along the beach! He also loves to play with his sisters Amanda, 10, and Victoria, 1. Jose has Down syndrome. He loves to greet people and to make new friends He lives with his parents, Jose and Barbara, his sisters, and his dog Midnight.

Would you like to share a favorite candid snapshot or slide of your child and/or family with other readers of EP? Send it to: Readers' Photos, EP (Exceptional Parent), 65 E. Route 4, River Edge, NJ 07661. (Please do not send originals or "one-of-a-kinds" as we regret that **photos cannot be returned.)** On a separate sheet of paper, write your child's full name, age at the time the photo was taken, address and daytime phone number. Please identify everyone in the photo. If you like, you can also write a few sentences about your child. Then look for a familiar face in an upcoming issue!

CARES Foundation, Inc.

by Kelly R. Leight

CARES (Congenital Adrenal hyperplasia Research, Education and Support) Foundation, Inc. is a non-profit, educational organization. Its purpose is to educate the public and physicians about all forms of congenital adrenal hyperplasia (CAH), its symptoms, diagnostic protocols, treatment, genetic frequency, the necessity for early intervention and benefits of newborn screening. It is also dedicated to providing support and information to affected individuals and their families.

Congenital adrenal hyperplasia (CAH) is a family of inherited disorders affecting the adrenal gland. The most common form is 21-hydroxylase deficiency, which is inherited in severe or mild forms. The severe form, called classical CAH, is usually detected in the newborn period or in early childhood. The genetic frequency of classical CAH is approximately 1 in 15,000 births. The milder form, called non-classical CAH (NCCAH), may cause symptoms at anytime from infancy through adulthood. Non-classical CAH is a much more common disorder than classical CAH. It affects 1 in 100 in the general population of New York City and is most common in certain ethnic groups. It affects 1 in 27 Ashkenazi Jews, 1 in 40 Hispanics, 1 in 53 Croatians, and 1 in 300 Italians. This frequency makes NCCAH the most frequent genetic disorder identified to date.

CAH and NCCAH are autosomal recessive genetic disorders. Scientists have pinpointed the location of the group of genes that causes CAH to chromosome 6. DNA testing is now available for diagnosis of CAH and NCCAH and to detect carriers of the gene mutations.

This particular group of genes contains instructions that the adrenal glands (which are located on top of the kidneys) need in order to produce a certain enzyme (21-hydroxylase). Without this enzyme, the adrenal glands are unable to synthesize cortisol, a hormone necessary for life, in physiologically sufficient amounts. To compensate for this, the pituitary gland in the brain stimulates the adrenal gland to produce more steroid precursors. As a result, however, androgens (masculizing steroid hormones) are produced in excessive amounts. In addition, more than 75 percent of all babies with classical CAH lack another adrenal hormone, aldosterone, which regulates sodium and potassium, necessary for maintaining normal fluid volume of the body. These babies become very ill soon after birth if not diag-

Caring for the Most Vulnerable

One mother's search for information on her daughter's disability uncovers a dire need.

Kelly R. Leight, executive director and founder of CARES Foundation, Inc., shares her story

"When my 7-year-old daughter, Alyssa, was diagnosed with non-classical congenital adrenal hyperplasia in February 2000, I was worried, shocked and upset. I wanted support, and I wanted information. Naturally, I went to the Internet to find answers. I was surprised to find that there was no organization specifically dedicated to CAH or much in the way of support for families going through the difficulties of dealing with and understanding this disorder. Some information was out there if you searched hard enough, but there was no centralized resource. I wanted to create a centralized source of information on the Internet, as well as provide support services to the CAH community.

Alyssa Leight

"At the same time, I became aware of how little the non-endocrine medical community knew about both classical and non-classical CAH. I became concerned about a trend toward characterizing symptoms of early puberty, often the first sign of non-classical CAH in children, as normal or benign. If further tests were not conducted on my daughter and a referral made to a pediatric endocrinologist, my daughter would have gone undiagnosed and suffered irreparable harm. I wanted to help publicize the danger in promoting this myth of early puberty, as well as to educate the public, the ethnic groups most affected, and the medical community about the signs, symptoms and genetic frequency of non-classical CAH.

"I also learned of the life-saving benefits of newborn screening for CAH. At the time, I was surprised to find that my own state, New Jersey, did not screen for CAH at birth, but many others did. I went on a quest to get the state to add CAH to its screening program in addition to bringing its newborn screening services to include all other diseases that can be screened for at birth. The effort paid off, and now New Jersey mandates newborn screening for more disorders than any other state. I hope to encourage other parents and affected individuals to get involved in newborn screening advocacy."

nosed and treated promptly. The remaining 25 percent, who produce sufficient aldosterone, are called "simple virilizers."

Classical CAH

Salt-wasting classical CAH must be detected at birth to avoid adrenal crisis, which can lead to death. Infant females generally come to medical attention because the disorder causes affected females to exhibit recognizable genital abnormalities. The clitoris is usually enlarged, and may even look like a small penis, and the labial folds may be joined to resemble the scrotum. Sometimes, if the extent of ambiguity is great, the female baby may be misidentified as a male. These abnormalities are only external. The female reproductive internal organs are not affected and are intact. Male babies with CAH appear normal at birth. Newborn males show no other outward signs of the disorder and are sent home without treatment. These babies sometimes present for urgent medical attention at a time when they are beyond resuscitation.

Because the condition is life-threatening if not treated soon after birth, many states require newborns to be screened for classical CAH. Currently, less than half of our states screen newborns for CAH as part of routine newborn screening testing. CARES Foundation, Inc. is working to expand newborn screening for CAH.

Non-classical CAH (NCCAH), is much more common than classical CAH. A study of New York residents found it affected 1 in 100 people. But—perhaps because it is less severe and harder to recognize than the classical form of the disease—NCCAH has not received the attention it deserves as a widespread condition that affects health and quality of life.

NCCAH is a variation of CAH that: can begin at any time from early childhood to early adulthood; is not immediately life-threatening; has a range of symptoms which overlap with other disorders and therefore may not be easily diagnosed; is less likely to be diagnosed promptly.

Girls born with NCCAH have normal genitals. Boys also appear normal. Because the symptoms begin later in life, NCCAH is sometimes called late-onset CAH, adult-onset CAH, or the attenuated form of CAH.

Symptoms of NCCAH

NCCAH symptoms vary from person to person; in addition one person's symptoms may come and go over time. They can begin at any time in life, but frequently start in early childhood. These symptoms are often mistaken for premature puberty in girls this is before age 8 and boys before 9.

BOTH MALES AND FEMALES WITH NCCAH MAY SHOW THE FOLLOWING:

- Premature development of body hair (pubic and underarm);
- Body odor (young children's perspiration normally has no odor);
- Early, rapid growth spurt, but ultimately short stature as adult;
- Oily hair and skin;
- Severe acne;
- Anxiety, depression, mood swings, migraines;
- Infertility;

SYMPTOMS IN GIRLS AND WOMEN:

- Early age of first menstrual period;
- Menstrual irregularities;
- Baldness, especially at the temples (male pattern baldness);
- Excessive hair growth; facial hair on chin and upper lip may be thick, coarse, and

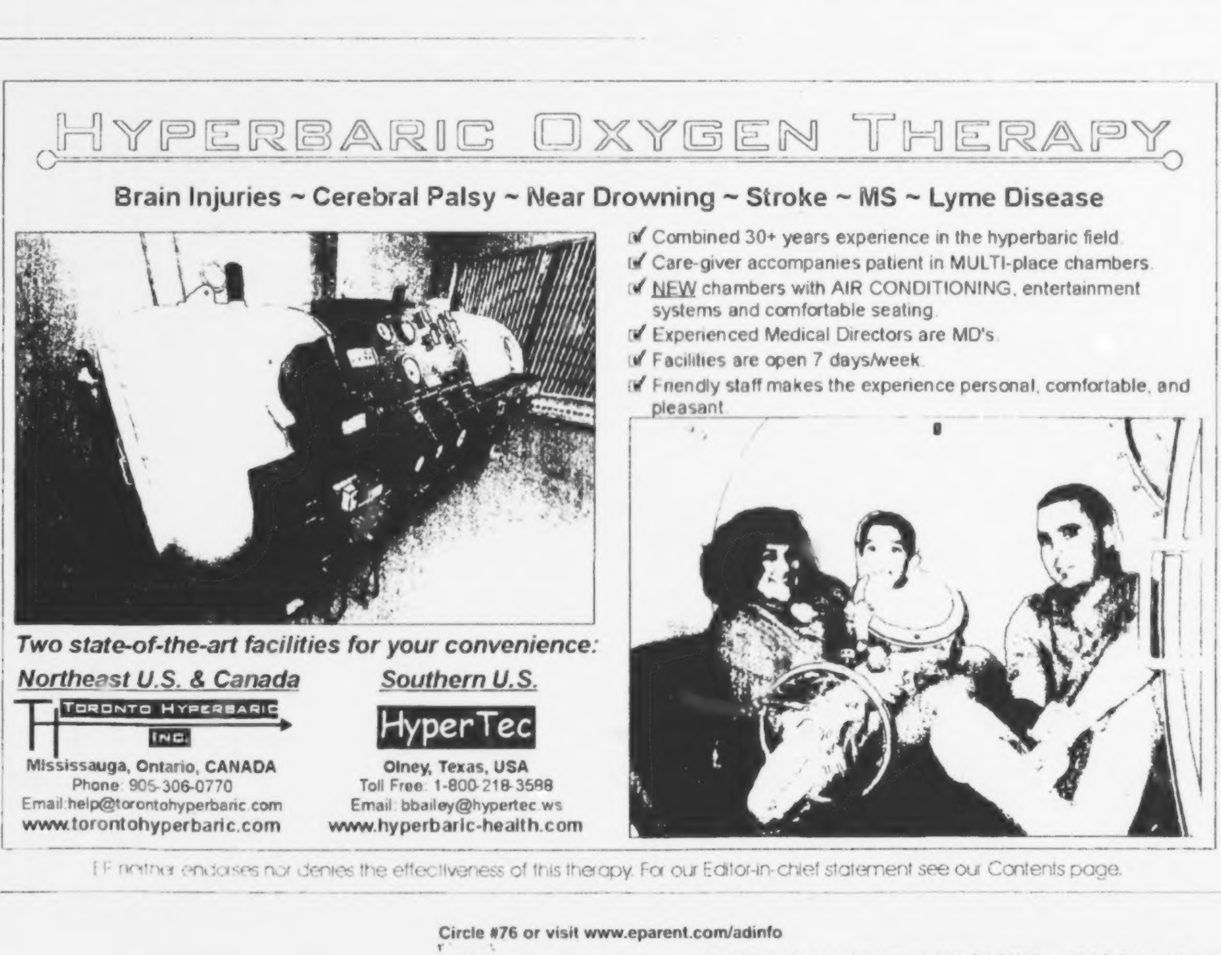
Getting Action

HEALT
ospit.: • Ove
Ridge • Th

Acting Governor Donald T. DiFrancesco (pictured at right with Kelly Leight and her daughter, Alyssa) announced in April 2001 that New Jersey will expand its statewide system of newborn testing to include 14 disorders which, if not caught early, can cause severe health problems, mental retardation and even death. In July, the state added newborn screening for biotinidase deficiency, congenital adrenal hyperplasia (CAH), cystic fibrosis, and maple syrup urine disease. In January 2002, six more tests were added for the fatty acid oxidation disorders (MCAD, SCAD, LCAD and VLCAD) and two urea cycle disorders, arginosuccinic acidemia and citrullinemia.

For more information on the New Jersey decision, the report of the Newborn Screening Advisory Panel is available on the Department of Health and Senior Services web site at http://www.state.nj.us/health.



HYPERBARIC OXYGEN THERAPY

continued from page 75

dark; • Polycystic ovary syndrome (PCOS);

IN MALES, NCCAH CAN ALSO PRODUCE:

- Early beard growth;
- Enlarged penis with comparatively small testes;
- Low sperm count;
- Short stature

If these symptoms are present, it's important to consult a board-certified pediatric endocrinologist or adult endocrinologist.

Treatment of NCCAH

With proper treatment, the outlook for a healthy life with NCCAH is excellent. NCCAH is treatable with oral glucocorticoids. A board-certified pediatric endocrinologist will be able to judge whether to add additional medications, such as a gonadotropin-releasing hormone analog to inhibit brain stimulation of the adrenal production of steroids.

New Developments in Treatment and Research on CAH and NCCAH

CARES Foundation, Inc.'s medical advisor, Maria I. New, MD, professor and chair, Department of Pediatrics and chief of the Division of Pediatric Endocrinology at New York Presbyterian Hospital-Weill Cornell Medical Center is currently conducting research into possible gene therapy to treat CAH and NCCAH. This is one of the most promising developments in finding a cure for this disease.

NeoGen Screening, Inc., a leader in developing and refining techniques used to detect inherited diseases in the newborn and a private provider of newborn screening services, has received a research grant from NIH to refine screening techniques for CAH. Current screening reliably picks up only babies with the salt-wasting form of CAH. This grant will expand the sensitivity of the testing to include detecting the non-classicals as well. **EP**

FOCUS ON PEDIATRIC MOVEMENT DISORDERS:

MYOCLONUS

By Terence D. Sanger, MD, PhD
with Joy E. Bartnett, NASW, AMIA, AMWA

Most people take for granted their ability to control their body movement. We *will* ourselves to move—walk across a room, sit in a chair or simply remain still. For millions of children, however, these simple, everyday acts are frustratingly difficult, if not impossible. These children are living with neurologic movement disorders.

The major neurologic movement disorders that may affect children include ataxia, bradykinesia, choreoathetosis, dystonia, myoclonus, spasticity, tics, and tremor. This article, the second in a series on pediatric movement disorders, offers timely information on the definition, causes, evaluation, diagnosis and treatment of myoclonus.

WHAT IS MYOCLONUS?

Myoclonus is a neurologic movement disorder characterized by sudden, quick, jerky, involuntary movements. These movements are usually extremely rapid or lightning-like. An attempted voluntary movement, a sensory stimulation or a sudden startle may trigger them, or they may occur continuously. Myoclonus may be observed as occurring rhythmically (as in myoclonic tremor) always affecting the same body parts or moving throughout the body. The condition may occur in the neck, back, face, a single limb or the entire body. If the symptoms of myoclonus are severe, children may lose their grip on objects, involuntarily throw objects, lose their balance or fall over.

There are many different causes, but in general, myoclonus occurs when a part of the brain or spinal cord is irritated or injured. Irritation may take the form of physical pressure (such as a tumor or local inflammation) or a chemical irritation because of toxins or other abnormal chemicals in the brain. While myoclonus in adults can be caused by a variety of minor and treatable problems, myoclonus in children often signals the presence of a more serious problem. For this reason, it is extremely important that children with myoclonus undergo a thorough evaluation for tumors, toxins, chemical imbalance and a variety of different diseases.

In some children, myoclonus is severely disabling, particularly when an attempted voluntary movement triggers myoclonic activity. In other children, the symptoms are relatively mild.

THERE ARE MANY DIFFERENT FORMS OF MYOCLONUS, INCLUDING:

- **Sleep myoclonus** is a normal and common form of mild myoclonus. It occurs frequently in both children and adults. Individuals with this form of myoclonus experience occasional brief jerking movements of an arm or a leg while falling asleep.
- **Negative myoclonus**, also known as asterixis, is characterized by a sudden involuntary relaxation, rather than contraction, of a muscle.
- **Action myoclonus** is triggered or worsened by attempts at movement.
- **Polymyoclonus** causes myoclonic jerks that can occur randomly throughout the body.

MYOCLONUS IS FREQUENTLY ASSOCIATED WITH EPILEPSY:

- **Epilepsia partialis continua** is a type of focal epilepsy that causes myoclonic tremor.
- **Progressive myoclonus epilepsies**; or PMEs, are a specific group of degenerative disorders in which the association of myoclonus and epilepsy is common.

The frequent association of myoclonus and seizure disorders suggests that there may be a common cause for myoclonus and certain types of epilepsy. Epilepsy, sometimes referred to as a "seizure disorder," is a neurological disorder characterized by episodes of abnormal electrical activities within the brain. These episodes typically cause seizures that affect awareness, movement or sensation.

UNDERLYING MECHANISMS IN THE CENTRAL NERVOUS SYSTEM RESPONSIBLE FOR MYOCLONUS

The precise nature of the underlying mechanism(s) responsible for the development of myoclonus is not fully understood. Myoclonus may be categorized according to the most likely source of these movements within the central nervous system. These include:

- **Cortical myoclonus** – originating in the outer layer of the brain or cerebral cortex;
- **Subcortical myoclonus** – originating within deep portions of the brain or brainstem and
- **Spinal myoclonus** – originating within the spinal cord.

Cortical myoclonus is possibly a result of lack of control within the brain's sensory or motor cortex; however, the reason is not known. Subcortical myoclonus is often caused by abnormalities in the brainstem. Spinal myoclonus is presumed to stem from abnormalities in certain spinal inhibitory circuits.

Another distinct group of disorders associated with myoclonic movements is known as startle syndromes. These disorders, which are characterized by explosive, jerking movement in response to environmental

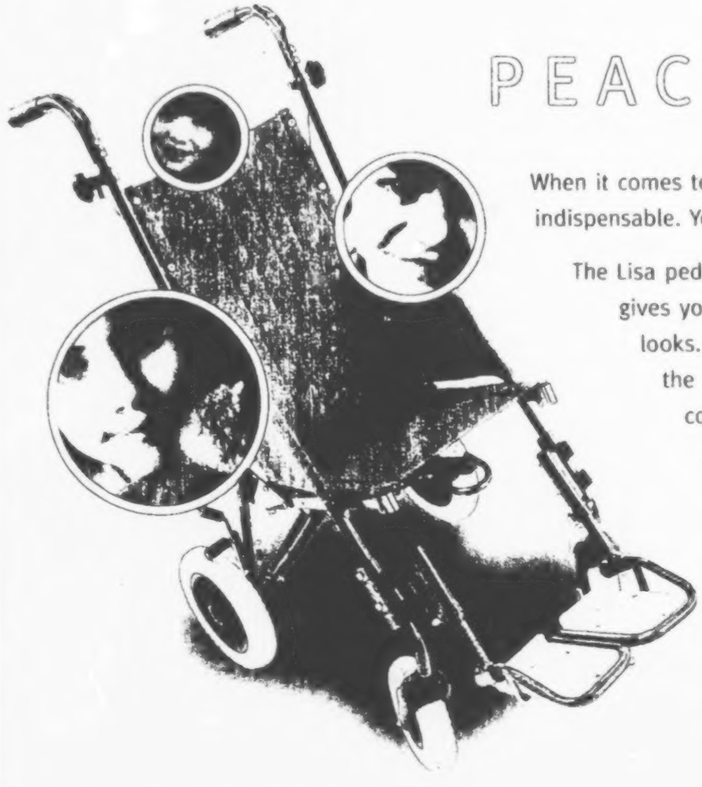
Ask the Doctor addresses issues of concern to our readers. Parents should review any suggestions made in this column with the appropriate professionals. Mention of specific products or medications illustrate suggestions and are not endorsements of any specific products. Send questions to: Ask the Doctor, Exceptional Parent, 65 East Route 4, River Edge, NJ 07661; Fax: (201) 489-0074; or E-mail: epedit@aol.com.

WHAT ARE THE VARIOUS FORMS OF MYOCLONUS AND WHAT ARE THEIR UNDERLYING CAUSES? Myoclonus and its various forms include:

- Physiological myoclonus including normal sleep myoclonus and benign myoclonus of infancy;
- Essential myoclonus including familial essential myoclonus, essential myoclonus-dystonia, and stimulus-sensitive myoclonus;
- Epileptic myoclonus including juvenile myoclonic epilepsy, progressive myoclonic epilepsies (PME), epilepsia partialis continua, Rasmussen's encephalitis, early infantile myoclonic encephalopathy, infantile spasms (also known as West syndrome), Lennox-Gastaut syndrome, benign familial myoclonic epilepsy, and Angelman syndrome; and
- Symptomatic myoclonus, including:
  - fixed injuries such as carbon-monoxide poisoning, hypoxic injury or near-drowning (Lance-Adams syndrome), heatstroke, trauma, stroke, or electrocution;
  - storage or degenerative myoclonus such as sialidoses (cherry-red-spot-myoclonus); lipidoses; lysosomal storage diseases (e.g., Niemann-Pick type C, Tay-Sachs, Sandhoff's); other storage disorders (neuronal ceroid lipofuscinosis, neuronal brain iron accumulation type 1, Wilson's disease, Lafora body disease); Baltic myoclonus; spinocerebellar ataxias or SCAs; dentatorubropallidoluysian atrophy (DRPLA); multiple sclerosis; and certain mitochondrial disorders;
  - Infectious or parainfectious myoclonus, such as new-variant Creutzfeldt-Jacob disease (nvCJD); subacute sclerosing panencephalitis (SSPE); viral encephalitis; and streptococcal infections;
  - Endocrine-based myoclonus such as myoclonus associated with hyperthyroidism, hyponatremia, or hypoglycemia;
  - Structural myoclonus including tumors that irritate the brain in a direct manner, tumors that release chemicals into the blood (as in abdominal or thoracic neuroblastoma, which causes the opsoclonus-myoclonus-ataxia syndrome), palatal myoclonus (with injury to the Guillain-Mollaret triangle in the brainstem and cerebellum);
  - Drug- or toxin-induced myoclonus. Drugs in this category include: anti-seizure medications (e.g., valproate, carbamazepine, etc.); antidepressants (e.g., amitryptaline, nortryptaline, desipramine, fluoxetine, sertraline, lithium, etc.); stimulants (e.g., amphetamine, dexedrine, methylphenidate, some asthma inhalers, caffeine, etc.); medications that are toxic to the liver, respiratory depressants, corticosteroids, amiodarone, acyclovir, bismuth, thallium, L-dopa;
  - Myoclonus associated with systemic illness such as dialysis, renal failure, liver failure, pulmonary disease or carbon dioxide intoxication.



PEACE OF MIND

When it comes to your child, you don't compromise. Safety is indispensable. You demand quality. Reliability. Functionality.

The Lisa pediatric postural mobility system from Otto Bock gives you all this while maintaining its playful good looks. So go ahead. Take it "off sidewalk". Recline the back rest up to 130°. Accessorize to your heart's content. And enjoy how easily it folds and how little it weighs. You and your family deserve it.

For more information, visit www.ottobockus.com, or call 1-800-328-4058 to find a dealer near you.

continued from page 77

sounds or stimuli, typically involve excessive activity or hyperexcitability of the normal brainstem's "startle circuits." There may also be diminished control in spinal circuits.

HOW IS MYOCLONUS DIAGNOSED AND EVALUATED?

The diagnosis and evaluation of myoclonus may be challenging and is based upon:

(1) a thorough clinical assessment;
(2) evaluation of the nature of the myoclonus with specific testing of muscle activity (electrophysiologic testing);
(3) assessment of where the symptoms occur and factors that provoke or induce episodes of symptoms; and
(4) a comprehensive patient and family history.

The measurement of specific patterns of electrical activity in brain and affected muscle(s) may be necessary to assist the physician in pinpointing specific myoclonic activity. Specialized testing is often conducted, including electrical recording techniques such as:

- **Electromyography (EMG)**: An EMG of the muscles typically shows the duration and frequency of the myoclonic bursts, and whether these bursts spread to other spinal segments (as is seen in propriospinal myoclonus). It may also be helpful in determining whether jerking movements occur simultaneously in more than one limb, or whether they flow gradually down the body.
- **Electroencephalography (EEG)**: During an EEG, small electrodes that are placed on the head measure electrical activity within the brain. Abnormal episodes of activity are recorded and may be evidence for the presence of epilepsy.
- **Reflex studies (evaluation of somatosensory evoked potential (SEP))**: In cortical myoclonus, there may be an excessively large brain electrical response to electrical stimulation of the hands or feet. In some cases, it is also possible to demonstrate the myoclonic electrical signal in muscle. This is done with a "tendon tap," during which the physician literally taps on the tendon of the affected muscle and then observes the electrical response.

In any form of myoclonus, it is important to look for an underlying cause. Any medication or toxin that could produce myoclonic symptoms should be discontinued if possible. The family history needs to be investigated. Metabolic studies may be appropriate, particularly if there are other symptoms or symptoms that are progressively worsening. Metabolic tests may include screening for treatable disorders such as Wilson disease.

Since myoclonus may be a symptom of general systemic illness, including liver failure and some types of tumors, it is important to screen for general health problems. In children with opsoclonus-myoclonus syndrome (myoclonic movements with a random, dance-like jerking of the eyes in all directions), routine tests may include a CT scan or other imaging of the chest and abdomen as well as blood and urine tests. These tests look for evidence of a particular type of nervous system tumor known as a neuroblastoma tumor. A neuroblastoma may cause symptoms that are similar to those found in children with opsoclonus-myoclonus syndrome. These tests help

continued from page 79

to identify a possible neuroblastoma and enable early, appropriate treatment.

An advanced imaging technique known as magnetic resonance imaging (MRI) may be employed to help evaluate for evidence of a tumor, stroke, brain malformation, or other structural lesions near the brain's cortex, the brainstem or the cerebellum. These tests are particularly important if the myoclonus is limited to a particular area of the body or if the child is suspected of having a rare form of epilepsy known as epilepsia partialis continua. Since certain viral infections may cause myoclonus, a spinal tap is sometimes necessary in order to test for such infections.

MYOCLONUS MAY OCCUR ALONG WITH OTHER MOVEMENT DISORDERS

Myoclonus may occur along with other movement disorders. Therefore, physicians should evaluate children for evidence of dystonia, tremor, ataxia, and spasticity. Physicians may also observe for opsoclonus. This eye movement occurs in the opsoclonus-myoclonus-ataxia syndrome, which is characterized by random eye movements, myoclonic movements, and difficulty walking and maintaining balance.

To determine if symptoms improve or worsen with a voluntary activity, physicians may choose to observe children while attempting to drink from a cup. Myoclonic jerks may also be caused by unexpected, loud noises or by a gentle tap on the tip of the nose or on the forehead. Sometimes myoclonic movements have a definite rhythmic pattern and always involve the same area(s) of the body; however, in other children, the symptoms may be without rhythm and move from one part of the body to another.

To test for negative myoclonus, children are asked to extend their arms with the wrists back or to perform some other movement that requires them to hold the limb against gravity. If negative myoclonus is present, the sudden loss of muscle contraction causes the hand or the arm to fall downward.

IS TREATMENT AVAILABLE FOR CHILDREN WITH MYOCLONUS?

Some children with essential myoclonus or essential myoclonus-dystonia improve with small amounts of alcohol. A small amount of alcohol may be administered in order to assist in the diagnosis of myoclonus; however, alcohol is not helpful in long-term treatment.

When a specific cause for myoclonus is identified, such as another movement disorder or other neurologic condition, the symptoms of

THE MELMARK SCHOOL
2600 Wayland Road, Berwyn, PA 19312 ◆ 1-888-MELMARK ◆ Fax (610) 353-4956 ◆ www.melmark.org

Our approved private day and boarding school serves children ages 5-21 who have:

- Autism/Pervasive Developmental Disorders/Asperger Syndrome
- Acquired Brain Injuries
- Cerebral Palsy
- Mental Retardation
- Neurological Disorders

Situated on an 80-acre country campus, Melmark's goal is to maximize independence through "best practices" in Applied Behavior Analysis, functional curriculums, vocational training and collaborative services.

We Offer Your Child:

- Low Student/Teacher Ratios
- Applied Behavior Analysis
- Functional Communication Skills
- Adaptive Physical Education, Aquatics, and Therapeutic Horsemanship
- Physical, Speech and Occupational Therapy
- On-Site Physicians and 24-Hour Nursing
- Psychological and Family Support

To arrange a personal visit, request a brochure or video, contact Peter McGuinness, Director of Admissions, at 1-888-MELMARK Ext. 636 or email admissions@melmark.org

Circle #59 or visit www.eparent.com/adinfo

myoclonus are usually effectively resolved by treating the underlying disease. For example, if the identified cause of myoclonus is a tumor within the brain, surgical treatment may resolve the myoclonus.

In certain cases, the treatment of myoclonus is symptomatic and supportive. Symptomatic treatment of myoclonus usually includes the use of benzodiazepines. These belong to a specific class of drugs that act to "slow down" the activities of the central nervous system. These drugs may include clonazepam or diazepam.

OTHER TREATMENTS:

- **Intravenous immunoglobulin** has been used on an experimental basis to treat some children with myoclonus.
- **Plasmapheresis** has been investigated for use in the treatment of certain children with myoclonus. During this procedure, whole blood is removed from the body and then blood plasma (not blood cells) is replaced with saline or a plasma substitute and reinfused into the body. More studies are needed to determine the safety and effectiveness of plasmapheresis for the treatment of myoclonus.

EXAMPLES OF TREATMENT FOR SPECIFIC FORMS OF MYOCLONUS:

- **Immune-mediated myoclonus**, as in children with opsoclonus-myoclonus, typically requires treatment with oral steroids such as prednisone.
- **Juvenile myoclonus epilepsy** usually responds to valproate, and may require life-long treatment.
- **Cortical myoclonus** may respond to valproate, piracetam, or lamotrigine.
- **Myoclonus due to an event involving hypoxia** may respond to 5-hydroxy-tryptophan (5HT). There are scattered reports of this response. It is also possible the 5HT may be helpful for myoclonus that is caused by other factors. EP

FREE PRODUCT & SERVICE INFORMATION

A SPECIAL SERVICE FOR EXCEPTIONAL PARENT READERS!

This Reply Card enables you to receive FREE information about products and services seen in EXCEPTIONAL PARENT.

How to use this service:

1. Locate the number at the bottom of each ad or refer to the Directory of Advertisers.
2. Circle the numbers on the Reply Card that correspond to the companies or products about which you would like to receive free literature.
3. Fill in your name and address on the card and mail the postage-paid card. You will receive free literature from each company for which you circled a number.
4. If both Reply Cards have been removed from this issue, just call or write to the companies directly.

Be sure to tell them you saw their ad in EXCEPTIONAL PARENT!

An Example of Full Inclusion: PREVENTION OF ORAL DISEASES

by Christine Ernst Miller, RDH, MHS, MA

Many of us consider ourselves advocates working to advance full inclusion of individuals with special needs. Significant progress has been made over the past several decades in improving educational, recreational, work-oriented and social opportunities. Yet in the realm of health and total well being, issues related to oral health are one of the most commonly cited problems by people with special needs. Often, just locating a dentist to treat a dental emergency or to repair a tooth is a major accomplishment. Difficulties accessing timely and appropriate dental services combined with complex lives can push prevention of oral diseases off the radar screen for individuals, parents or caregivers. Full inclusion includes prevention of oral diseases.

Prevention of oral diseases is much, much more than a cosmetic task accomplished with a toothbrush. The cornerstone of prevention is really the heart. Being pro-active and caring closely follow and together can overcome most obstacles.

The complete picture of prevention is composed of four major areas: a positive attitude, policy and programs; the adoption of the medical model; assessment; and the use of a customized oral health plan. For a lifetime of oral health without episodes of pain, bleeding or overgrown gums, or loose or decayed teeth, these four areas should be addressed.

Attitude, Policy and Programs

Imagine what life would be like if social service and healthcare professionals, policy makers, legislators and health insurance administrators all considered preventive oral health an essential service for people of all ages with special needs. Results of the 1994-1995 National Health Interview Survey on access to care and use of services by children with special healthcare needs indicated that the most prevalent unmet need was dental care.

Positive attitudes about prevention by the professional team, parents, caregivers, direct support professionals (DSPs) and the person with a disability also have a profound impact on the reality of day-to-day preventive measures. It is time to stop segregating it as a dental-only issue; oral health is an issue of total well-being.

For a lifetime of good oral heath, attitudes and action leading to services should start at infancy. Think of what it would be like if, in early start health programs, infants' and toddlers' oral condition were evaluated along with hearing and vision. Yet even when dental health programs are available they are poorly used. For example, all children and adolescents enrolled in Medicaid are entitled to comprehensive dental services through Early and Periodic Screening, Diagnostic and Treatment program. However, only one in five of those children and adolescents actually receive such services.

Dental professionals and families often cite reimbursement issues as a barrier to care. What if there were a dental insurance coverage for "extra time and management"? Or if imagine adult prevention services were covered by Medicaid nationally, not just in some states? Even with existing insurance coverage, 55 percent of preschool-age children and 50 percent of school-age children do not have private dental insurance. For African-American preschool-age children, 65 percent are without coverage from private dental insurance.

Adoption of the Medical Model

Two types of diseases can occur in the mouth: cavities (also called decay and caries) and gum disease. Cavities and gum disease are the result of different types of bacteria and the body's reaction to them.

Diet, Demineralization and Dental Caries

What causes cavities in children and adults? Cavities are caused by acids which are produced when bacteria eat available sugars in the mouth. Sugar foods are fermentable carbohydrates such as sucrose, glucose, fructose and cooked starch. Cavity-causing (cariogenic) bacteria plus fermentable carbohydrates yield organic acids which can dissolve or demineralize teeth

Many people with special needs can be at greater risk of this dissolving process because of developmental disorders which cause weaker enamel. Additionally, some people have conditions such as GERD (gastro-esophageal reflux disease) that bring up acid from the stomach to the mouth. These acids too can dissolve the teeth.

continued on page 86

Suggestions for preventing oral diseases

Infants and toddlers:

Keep an infant's gums clean by rubbing gently with a washcloth moistened with water. This activity also can be a desensitization technique for children who are tactile defensive

Use a flexible, soft-bristled child toothbrush as teeth erupt.

Ensure daily fluoride by using a very small pea-sized amount of fluoridated toothpaste, starting at the age of one year. Wipe out excess toothpaste.

Seek an oral health consultation within six months of the eruption of the first tooth, as recommended by the American Academy of Pediatric Dentistry. This gives the child a pleasant, low-pressure experience with the health professional and can catch any problems, such as "nursing bottle mouth," early.

Avoid putting the baby to bed with a bottle of sweetened fluid (formula, breast milk or fruit juice). Instead, slowly dilute the liquid with water over several weeks and later use water only. Similarly, avoid leaving a bottle or sipper cup of sweetened fluid with the baby all day.

Infants' parents' and close caregivers' oral condition should be healthy, without active new carious(decay) areas . Mothers should have regular annual dental check-ups before and after the baby is born.

Parents and caregivers should examine their own prevention practices and attitudes about oral care visiting the dentist. What messages are being sent?

Some medications contain more than 50 percent sugar. When possible, have the child rinse and, especially at bedtime, brush the teeth and follow with a fluoride rinse or swab.

Ask about additional sources of topical fluoride to help with tooth repair.

Review the child's snacking behavior and/or food rewards used throughout the day. Day-long snacking on cereal, crackers and sweets feeds the cavity bacteria.

Ages 6 to 12 years

Place sealants on the new permanent molars. Watch for the eruption of the first permanent molars, starting when the child is about the age of six. Sealants are protective plastic coatings on the chewing surfaces of the teeth.

Look for excessive tooth crowding and ask if an orthodontic consultation is needed.

Continue with regular teeth cleanings and exams.

Examine the quality of the toothbrush. Use only a flexible, soft brush. Avoid hard and stiff brushes, as they can hurt and thus contribute to resistant behavior. Store each person's brush separately. Consider whether an electric brush might help now.

Consult with professionals. Use over-the-counter fluoride rinses or swabs once or twice a day for one minute, and brush with a fluoride-containing toothpaste.

Use floss holders to help the individual become as independent as possible and to protect against gum disease.

Use other rewards for behavior besides food. Especially avoid frequent use of decay-producing food such as candy, gum, soft drinks, etc., as rewards for desirable behavior at home and school.

Use mouth guards for children playing contact sports.

Adolescents and Adults

Arrange annual oral exams and annual or semiannual teeth cleanings. If the dental office does a "toothbrush" cleaning which lasts about 10 minutes, then the calculus/tartar will not be removed. Ask about a complete teeth cleaning.

Confirm that an oral cancer exam is done at the annual dental exam. Check regardless of whether or not the individual is using tobacco products—including chewing tobacco. This exam is needed for everyone as they age, including people without any teeth.

Consult with a behaviorist and other professionals, as needed, to maximize independence and acceptance of daily preventive measures.

Save all the teeth you can. When teeth are removed, the bone that supported those teeth slowly disappears (resorbs). Over time this leaves less and less bone for partials and dentures. When people are placed on soft, pureed diets because lack of teeth and/or poor chewing ability, constipation is more likely.

Continue to monitor access to foods and drinks containing sugars (fermentable carbohydrates) such as sucrose, glucose, and fructose. Unlimited access all day long to vending machines filled with these items at school and work is very tempting.

Continue to protect individuals prone to falling against trauma to the face and teeth.

Watch for behavioral signs in non-verbal communicators, such as refusal to eat or drink; head banging or rocking; hands or fingers in the mouth; or a rapid change in temperament such as an increase in social withdrawal. These actions may indicate the person has oral pain or infections

BEST COPY AVAILABLE

If the dissolving process is caught early, then the tooth can be repaired (remineralized) by the saliva. When saliva also has fluoride in it, the tooth repair is stronger. An added benefit is that the fluoride-repaired tooth is even more resistant to future acid attacks. Fluoride can come from drinking water, fluoride-containing toothpaste, and over-the-counter (OTC) products. Fluoridated water reduces by half the number of cavities a child could get. Stronger concentrations of fluoride for home use are available by prescription or can be applied in the dental office.

The Importance of Saliva

Good saliva flow is critical for maintaining strong tooth enamel. Often throughout the day, after we snack, drink or eat, the dissolving (demineralization) and repairing (remineralization) battle takes place in our mouths. The dissolving process is related to the acid-base balance in the mouth. Normally the pH or acid-base measure of saliva is neutral (pH of 7). When sugar foods are eaten and cavity-causing bacteria are present, in the first 5 minutes the pH drops and becomes more acidic (pH of 4). This acid environment makes possible the dissolving-the-teeth process. Over the next 25 minutes, the saliva, if available, neutralizes the acid, and the dissolving process stops.

It takes about 30 minutes after the sugar exposure for the acid-base balance to return to neutral (pH 7). Saliva makes this neutralizing—also called buffering—process possible. Yet people with special needs frequently take medications (including psychotropic drugs and antihypertensives) which dry out the mouth or reduce salivation (xerostomia). Thus, the buffering benefit of the saliva is diminished, and those people are more at risk for cavities.

Prevention of Dental Caries and Gum Disease

Several practical strategies for preventing cavities in high-risk people include: conducting a caries risk assessment of an infant's parents with active decay; use of an anti-bacterial agent, such as chlorhexidine, or fluoride varnish; checking for an adequate amount of saliva; enhancing the saliva remineralization process with a fluoride mouthrinse twice a day; reducing the number of cavity-causing bacteria by brushing and flossing twice a day; and protecting the chewing surfaces of permanent molars with sealants. Further research and consensus development conferences are needed to establish practical clinical protocols for high-risk groups.

Infants are not born with cavity-causing bacteria. When parents or other caregivers share food, for example, spoons, etc., thenthe bacteria can spread. Although the experts may disagree when the "window of infection" occurs, the proposed time period is between 18 months and 2 years old. However, bacteria may be transmitted as early as birth. If parents of infants have active cavity problems, then they should be examined and treated too. Recent research reported that use of xylitol gum by mothers reduced the spread (colonization) of cavity bacteria to infants.

To consider dental caries (decay) as a transmissible bacterial infection is a paradigm shift for many health professionals and the public. Adoption of the medical model in dentistry means focusing on who is most at risk and addressing the cause of cavities—the bacteria—rather than the result—the decayed tooth. Consult oral health professionals to customize the prevention plan for the unique needs and abilities of each person.

Another part of the medical model is the

continued on page 89

Partners in Prevention

You are not alone in your interest and advocacy for oral health for people with special needs. Organizations have lay, health and social service professionals who directly serve and work to increase access to restorative and preventive services for people with special needs. Some of these groups include the Academy of Dentistry for Persons with Disabilities(ADPD), founded 50 years ago and a member organization of Special Care Dentistry, ADPD can be reached at www.foscod.org/adpd.htm and the American Academy of Pediatric Dentistry , with resources on the Links, Links, Links page; reach them at: www.aapd.org. Special Olympics, Special Smiles at www.specialsmiles.org has information and links. For educational resources, the National Oral Health Information Clearinghouse (NOHIC) lists can be accessed at http://www.nohic.nidcr.nih.gov

To locate services or speakers in your area for parents, caregivers, DSPs, etc., start by asking your general dentist or pediatric dentist. Or find your local dental or dental hygiene school by accessing the American Dental Educators Association (ADEA, formerly AADS) at http://www.aads.jvs.edu. Ask dental schools for clinics and such post-graduate programs as General Practice Residency (GPR) or Advanced Education in General Dentistry (AEGD) Programs. Faculty and residents associated with these clinics as well as alumni may be available in your community. Other resources to locate dental professionals could be the local chapters of their professional societies. For example, to identify your local dental society chapter, contact the American Dental Association (ADA) Web site at http://www.ada.org; the Hispanic Dental Association at http://www.hdassoc. org; and/or the National Dental Association at http://www.ndaonline.org. To identify your local dental hygiene society/component, contact the American Dental Hygiene Association (ADHA) at: http://www.adha.org.

continued from page 87

concept of repairing or remineralizing the tooth. If cavities are caught early, then an over-the-counter (OTC) fluoride mouthrinse used twice daily for one minute could be beneficial. In the past, removing the diseased part of the tooth often was the focus of dental care. Fillings have little long-term effect on the cavity-causing bacteria.

Prevention of Gum Disease

Reducing the number of bacteria is also helpful for the prevention of gum disease. This is accomplished by focusing the toothbrush where the bacteria are most numerous: at the gumline, where the tooth and gums meet. Many bacteria also live between the teeth. Flossing can disrupt those bacteria and can be made easier with a floss holder. Some high-risk people

Make It a Healthy Smile: Finding what works for your child

Contributed by the HMS School

Kristen Millar

Kristen Millar, who has severe disabilities as a result of cerebral palsy, lives with her mother in Warminster, PA and attends Philadelphia's HMS School for Children With Cerebral Palsy as a five-day resident student. Although her parents separated twelve years ago, Kristen's father remains actively involved, spending time with her every weekend. She also has a close relationship with her older sister Jessica, who is married and lives nearby. Totally dependent on her family and life-skills assistants at school for all personal care activities, Kristen uses a manual wheelchair because she can't control a power chair. Although she cannot speak, she manages to communicate many of her needs and reactions with facial expressions and sounds. "She's not a grumpy kid, but she is persistent," said Mrs. Millar.

Kristen is unable to take anything by mouth because of poor muscle control, and receives all nutrition through a gastrostomy tube. She also drools appreciably and might gag or aspirate. Her condition has been further complicated by several bouts of acute pancreatitis and issues with gastric emptying. Despite two recent and difficult hospitalizations, Kristen has been remarkably healthy and retains her cheerful disposition.

Tube feeding has an impact on Kristen's oral health. On a positive note, she has no cavities because, unlike most young people, she doesn't eat refined sugars. But chewing helps to clean the teeth and stimulate the gums. With tube feeding, Kristen misses those benefits. In addition, saliva pools in her mouth, promoting an extreme buildup of calculus (also called plaque or tartar).

Kristen's family and the school work together to provide two critical aspects of her preventive oral care—brushing her teeth several times daily, and scheduling regular professional cleanings to remove the calculus and examine her teeth and gums. Through trial and error, her family and caregivers have learned the most successful approaches.

Mrs. Millar said, "Power toothbrushes have been the latest, greatest invention for her home care. They've made the process more gentle and productive for her." She brushes Kristen's teeth in the shower, with the water turned off. Kristen sits up in a shower chair where her head is elevated, facilitating the brushing. Mrs. Millar said, "It works so well...Kristen loves the shower, and the shower is so easy to clean up." Mrs. Millar taught Kristen to spit out toothpaste by making it a game rather than a chore. Over time, she has also talked a lot about not biting down on the toothbrush. She said, "Kristen's very cooperative for a kid who's extremely sensitive physically, particularly to touch around her mouth, but she does tend to bite down or regurgitate a little." Together, Kristen and her mother have worked out the kinks. Mrs. Millar said, "Earlier, her dental care was harder to do—she cooperates more now. We've become a better team, Kristen and I."

At HMS school, life skills assistant Linda Table is one of the staffers who clean Kristen's teeth three times a day with an electric toothbrush, to more easily remove tartar. Ms. Table uses only a small dab of toothpaste to avoid too much foam, which might cause Kristen to gag. She stands behind Kristen, using one hand to support Kristen's head with her mouth open so that she won't bite down and the other hand to brush. The process takes about five minutes. Linda said, "Kristen has a good attitude about it. She doesn't get upset easily." As part of her preventive care at HMS, consultants Dr. Robert Lloyd or Dr. Manuel Album examine Kristen every three months and clean her teeth with an ultrasonic scaler.

Protecting Kristen's oral health is an essential aspect of her total medical care. Good dental care also protects her lovely smile and visual appeal—an important part of positive social interactions at home, at school, and in the community. Kristen's family strives to give her oral pleasures without compromising her health. They'll apply flavored lip gloss to her mouth or give her a taste of different foods by putting a tiny bit on a finger and touching Kristen's lips. Mrs. Millar said, "She absolutely loves it. She'll stare at you, as if to say 'I want that and I want it now.'" She added, "We're crazy about Kristen. We get recharged hanging out with her."

BEST COPY AVAILABLE

continued from page 89

may also need a brush-on prescription antibiotic. With people who can spit out, use a fluoridated toothpaste, which will also help fight cavities.

Seek professional advice about the status of the gums, follow prevention recommendations and get regular teeth cleanings—once or twice a year. Some people at high risk may benefit from teeth cleanings 3 to 4 times per year, but logistics and cost can be a barrier. If cleanings are done twice a year under general anesthesia, then careful evaluation of the risk to the individual should be reviewed.

Overcoming behavioral, physical and informational barriers

For those individuals with special needs who need assistance or have behavior issues, there are a number of aids to make brushing easier, faster and more fun. Double-sided toothbrushes with flexible soft bristles are now available. With one motion, both sides of the tooth are brushed at the same time. To make the handle larger so the individual can be as independent as possible, poke a hole in a rubber ball 2 or 3 inches across and put the toothbrush handle into the ball. Powered toothbrushes are now available for about $20 to $25 per unit. A person's degree of independence is increased and assistance from the caregiver is lessened when the toothbrush used correctly.

Mouth props can be used to help hold the mouth open. These can be made with tongue blades and a washcloth, or they may be purchased. Assisting a person who needs help for most or all of the cleaning can be accomplished in another room, on the sofa or in other positions that are more comfortable for both of you. You can use a bowl for the person to spit into, or avoid the use of toothpaste. It is the physical movement of the bristles that disturbs the gum-disease bacteria; toothpaste is not needed.

Oral Health Assessments

Oral assessments are one way to put oral health on the radar screen. Physicians, nurses, social workers, OTs, PTs, nutritionists and agency administrators, plus individuals, caregivers or DSPs, should all be promoting oral health assessments. For example, in several social service agencies in California, one nutritionist and a physician were instrumental in starting agency-wide programs for oral health assessment.

Beyond the assessment, it is both professionals and those at home who must make the assessment and the customized preventive recommendations a reality on a day-by-day basis. For example, if the programs directors in a social service agency for people with special needs do not convey that total healthcare includes dental disease prevention, then the team—from the case manager to the parent—is likely to view prevention as a luxury or cosmetic task. It will not matter if a fluoride rinse or an electric toothbrush is in the cabinet if there is no oral health plan nor an expectation that preventive measures are a daily priority. This applies to individuals living with family, independently or in community-care facilities.

The Customized Oral Healthcare Plan

With the complex medical, nutritional, and social issues of children and adults with special needs, it can be challenging to remember oral health. But preventing gum and decay diseases today saves teeth and is easier than correcting the problem later. A plan helps everyone remember to prevent oral diseases. Copies of it should be found in the person's health chart and in binders in group homes, and it should be reviewed annually. The individual and the family should be educated to ask for this so it is written into the individual program plan (IPP) or the individual family service plan (IFSP).

An oral healthcare plan should address the various obstacles to oral health. Commonly cited obstacles can be divided into behavioral, physical, and informational (see the side bar for tips on prevention of gum and decay diseases). In surveys of parents, caregivers and DSPs, behavior issues are frequently listed as the biggest problem in carrying out regular oral healthcare processes. Desensitization, structuring the environment, and a reward system are some of the techniques for overcoming behavioral obstacles.

Addressing physical obstacles, such as a person's inability to hold a toothbrush or need for help with all or some of the hygiene, should be in the plan. Informational barriers can be eliminated through education and follow-up (see box, **Partners in Prevention and Suggestions for Prevention**).

To be comprehensive, the oral care plan must consider the full spectrum of preventive measures available today, such as reduction in sucrose exposure; use of fluoride by mouthrinse or swabbing; fluoride varnishes, sealants; chlorhexidine swabs or rinses; xylitol gum; and regular teeth cleanings.

The Last Word

The difficulties children and adults experience in accessing timely and appropriate dental care highlight the need for regular preventive measures. The increased vulnerability to dental decay and gum disease because of dry mouth, dependency on others, and competing, complex social and health issues, is further indication of the need for aggressive prevention measures. Progressive attitudes about providing preventive care and restorative and emergency dental services are the initial requisites of ensuring a lifetime of oral health.

Prevention-oriented attitudes serve as catalysts to promote the full inclusion of people with special needs into humane and timely preventive oral care. Prevention of oral diseases is much more a matter of the heart than the mind. Together we can make prevention a reality for people of all ages with special needs.

Christine Ernst Miller, RDH, MHS, MA is an Associate Professor, Director of Community Programs and co-Director of the Center for Oral Health for People with Special Needs at the University of the Pacific School of Dentistry. Also, she is President of the Academy of Dentistry for People with Disabilities.

ELLBEE'S FRIENDS POWERFUN!

Ellbee's Friends Powerfun is a math tutorial CD series designed to reach out to children ages 6 and up. The addition and multiplication CD features Ellbee the Lint Ball and it's twelve culturally and geographically representative animal friends. These characters come from around the world, and one uses a wheelchair. The series teaches, reinforces and tests math, listening and practicing skills in a fun and self-correcting way which encourages student response. Ellbee's Friends Powerfun can also be used as a springboard into studying other topics such as geography, wildlife, world music and cultures.

Ellbee's Friends Powerfun!, P.O. Box 30111, Chicago, IL 60630; Toll free Phone: (866) 456-9870; Local: (773) 304-0020; E-mail: info@ellbeesmath.com; Web site: http://www.ellbeesmath.com

CREEPSTER CRAWLER

The Creepster Crawler is a crawling aid that promotes movement while providing support for children with physical disabilities during independent locomotion development. The sturdy lightweight frame on pivoting casters includes a padded platform that can support a parent or therapist while working with the child on weight bearing or shifting, reaching and creeping skills. The foam-padded suspended harness system provides adjustable front shoulder and chest straps for an individual fit.

SHAKE-A-LEG MIAMI

continued from page 58

City of Miami Parks and Recreation Department and serves the public seven days a week. One new program provides sail training to Dade County Public School students as part of their adaptive physical education.

Pre-sail instruction with members of the Youth Program.

Shake-A-Leg also partners with the YMCA, Boys and Girls Clubs, and scouting organizations and even runs a summer water-sports camp. They also work in conjunction with Miami Lighthouse for the Blind and several community-based organizations for people with developmental disabilities. Sailing really is for everyone at Shake-A-Leg!

TOURISTS ARE WELCOME

Such a fabulous resource deserves to be known far and wide. Visitors to South Florida with disabilities and their friends and families should take advantage of this all-too-unique opportunity. Either stop by on Sunday afternoon during Open House, when you can try sailing or sea kayaking for free, or call ahead to reserve a boat and skipper on other days. The rates are very reasonable for all their water sports programs. And what a fabulous setting! Biscayne Bay is always gorgeous, with the city skyline in the background; I've even seen dolphins at play. A wheelchair accessible restaurant, Monty's Seafood House, is right across the parking lot from Shake-A-Leg, perfect for an aftersail drink or dinner. And CocoWalk is just a short drive away. To learn more, contact Allen Fiske, outreach director, Shake-A-Leg Miami. ▪

Camphill Special School
Children's Village

A not-for-profit residential school community where children with developmental disabilities are truly celebrated.

Is your child receiving a caring and compassionate education?

Since 1960, the families at Camphill Special School have invited children with special needs into their homes and into their hearts; living together as extended families they share the daily rituals of meals and chores, as well as the challenges of school and therapy.

Each House Parent has received specialized training and is prepared to nurture your child's capabilities and guide them toward a brighter future.

"The ONLY Difference"

by Christa Forman

As a child, Laura loved to open and close the bathroom door. She would stand in the hallway, fully clothed in her torn stocking pajamas, engaging herself in this fun-filled activity. Although she was barely tall enough to reach the doorknob, she continued to push and pull the door. While I sat in a chair across the room, I could see the gigantic smile on her face as her feet scraped and swished against the tile floor. Because she was diagnosed at an early age with pervasive developmental delay, Laura did many things that no one ever understood. Despite all of her limitations and differences, Laura has always been a truly unique and interesting person.

While a person may realize her disability in conversation, Laura's physical appearance does not reveal her differences. She has dark blond hair and deep, sky blue eyes. While many people cut off their hair when it becomes too long, she prefers to keep it long and flowing. She loves the hair to flap in her face. As a child, Laura was skin and bones, a small skeleton with crooked teeth. She would only eat salad. While I devoured everything from strawberries to hotdogs, my sister would eat only lettuce, tomatoes, and French dressing! Today, Laura has a strong passion for all kinds of food.

Laura Forman (left) celebrates Christmas with her sister, Christa, 17, and her brother Willie, 12.

Laura becomes obsessed with things very easily. If she loves something, then she absolutely loves it! When she was 6, she fell in love with *The Wizard of Oz* even though she already collected every figurine known to man, she still needed the movie and the soundtrack. She talked about *The Wizard of Oz* quite often. The following year, Laura grew out of this interest and began her passion for *Oliver!* the movie musical. "Here we go again!" I thought. She raved continuously about Oliver, Dodger, Bill Sykes, and other characters in the film. The lyrics from the musical blared through the house every hour. Still, there were other muses to be had. At the age of 15, her infatuation with the Backstreet Boys started. Covering her doors were posters of these dreamy singing sensations. She had to own any and every magazine which contained the smallest picture of the boys. Today, Laura still remains a true "fanatic" of these boys.

Laura is also a very sweet and caring person. For example, when she was 5 years old, she fell and hit her head on my grandmother's porcelain coffee table. As my brother Willie and I returned from the store, we saw her sitting on the patio with her mouth bleeding. She was immediately rushed to the hospital where her jaw was sewed back to its former shape with countless stitches. When the nurse gave Laura the hospital bracelet, she immediately said (with her mouth full of stitches), "One for Christa and Willie too!" This story reminds me how she constantly thinks of other people.

The other day I watched Laura return to her residential school. I remembered the girl who ate only salad, who loved to open and close the bathroom door, and who thought about me even in times of pain. As I watched her enter her house, I realized that Laura has never really changed from the small girl she once was. Today, whenever she opens or closes a bathroom door, I laugh and remember the gap-toothed toddler whose smile would fill the entire room. The musical group The Wallflowers once sang, "The only difference, that I see, is you are exactly the same as you used to be." No matter how much she grows, she will always be the same Laura. **EP**

For people with severe spasticity due to cerebral palsy, brain injury, or spinal cord injury

There is something you can do about severe spasticity. Oral medications may help some people with severe spasticity, but for many, it may not be effective or may cause intolerable side effects. When spasticity continues to interfere with the way you live, there is something you can do about it.

ITB™ Therapy (Intrathecal Baclofen Therapy) is an effective way to control severe spasticity. A medication called Lioresal® Intrathecal (baclofen injection) is delivered directly to where it's needed most — in the fluid that surrounds the spinal cord. In clinical studies, ITB Therapy reduced spasticity during the screening test in 97%[1] of people with severe spasticity due to multiple sclerosis or spinal cord injury, and in 86%[1] of people with severe spasticity due to cerebral palsy or brain injury.

Take the first step. Find out how the therapy can work for you. Talk to your doctor about the screening test, which uses a small amount of medication to test if it will work for you. For more information call us today at 800-664-5111 Ext. 220. Or, you can log on to www.spasticity.com.

ITB Therapy drug side effects are usually temporary and manageable by adjusting the dose. The most common side effects include loose muscles, drowsiness, nausea/vomiting, headache, and dizziness. Close attention to your doctor's instructions is required since abrupt discontinuation of intrathecal baclofen can result in high fever, altered mental status, returned spasticity, and muscle rigidity, and in rare cases has been fatal. (For more information, please read the attached Lioresal Intrathecal Patient Information on the back.)

Medtronic
When Life Depends on Medical Technology

Patient Information

LIORESAL® INTRATHECAL
(baclofen injection 10 mg/5 mL, 10 mg/20 mL, 0.05 mg/1 mL)

Completely read this information before you start using Medtronic ITB™ Therapy (Intrathecal Baclofen Therapy). This information does not take the place of thorough discussions with your doctor. You and your doctor should discuss ITB Therapy before you begin receiving the therapy and at regular refill appointments.

Q: What is Lioresal® Intrathecal (baclofen injection)?

A: Lioresal Intrathecal is a liquid form of baclofen, and is commonly used to treat severe spasticity. Liquid baclofen is used for injections and infusion into the intrathecal space (the fluid-filled area surrounding the spinal cord), using an implantable drug delivery system.

Q: What is severe spasticity?

A: Severe spasticity is tight, stiff muscles that make movements – especially of the arms and legs – difficult or uncontrollable. Severe spasticity can interfere with an individual's function and/or comfort.

Q Who is a candidate for Lioresal Intrathecal?

A: People who suffer from severe spasticity resulting from cerebral palsy, multiple sclerosis, stroke, traumatic brain injury, or spinal cord injury, and who suffer intolerable side effects from oral baclofen (pills), may be a candidate for Lioresal Intrathecal. A screening test will help determine if you will respond to the intrathecal medication. Talk with your doctor about whether Lioresal Intrathecal may be an option for you.

Q: Who is *not* a candidate for Lioresal Intrathecal?

A: People who are hypersensitive (extremely sensitive) to oral baclofen should not take Lioresal Intrathecal.

Q: What are the most common side effects of Lioresal Intrathecal?

A: The side effects of intrathecal baclofen include loose muscles, sleepiness, upset stomach, vomiting, headaches, and dizziness. As with most medications, overdose (drug dose is too high) or under dose (drug dose is too low) can occur. Talk with your doctor about the side effects you may experience from your treatment.

Q: What do I need to know if I am using Lioresal Intrathecal?

A: Abruptly stopping intrathecal baclofen can result in serious medical problems and in rare cases has been fatal.

Q: What are the signs of rapid or abrupt withdrawal from intrathecal baclofen?

A: Increase or return in spasticity, itching, low blood pressure, lightheadedness, and tingling sensation are often early indications of baclofen withdrawal. It is very important that your doctor be called right away if you experience any of the above symptoms.

In rare cases, severe symptoms may occur. These symptoms include high fever, altered mental status, spasticity worse than before you started ITB Therapy, and muscle rigidity. It is very important that your doctor be called right away if you experience any of the above symptoms.

Q: What can I do to prevent baclofen underdose or abrupt discontinuation of intrathecal baclofen?

A: It is very important that you keep all of your refill appointments. This may require some planning prior to traveling. Maintaining a regular refill schedule will ensure the pump does not run out of medication and that any potential problems with the infusion system are diagnosed and corrected. Additionally, you should be aware of what your pump alarms sound like. If you hear the alarm, contact your doctor immediately.

Furthermore, it is very important that you know and understand the signs of baclofen underdose. Also be sure to tell your doctor right away if you experience any unusual symptoms, side effects, or changes in your condition.

Q: What are the symptoms of baclofen overdose?

A: Although rare, it is possible for you to receive too much medication (overdose). A baclofen overdose may cause drowsiness, lightheadedness, respiratory depression (difficulty breathing), seizures, loss of consciousness and coma. If you experience any of the above symptoms, it is very important that you or your caregiver contact your doctor right away.

Rx only.

CAN YOU FIND THE SYMPTOMS OF CARNITINE DEFICIENCY IN THIS PICTURE?

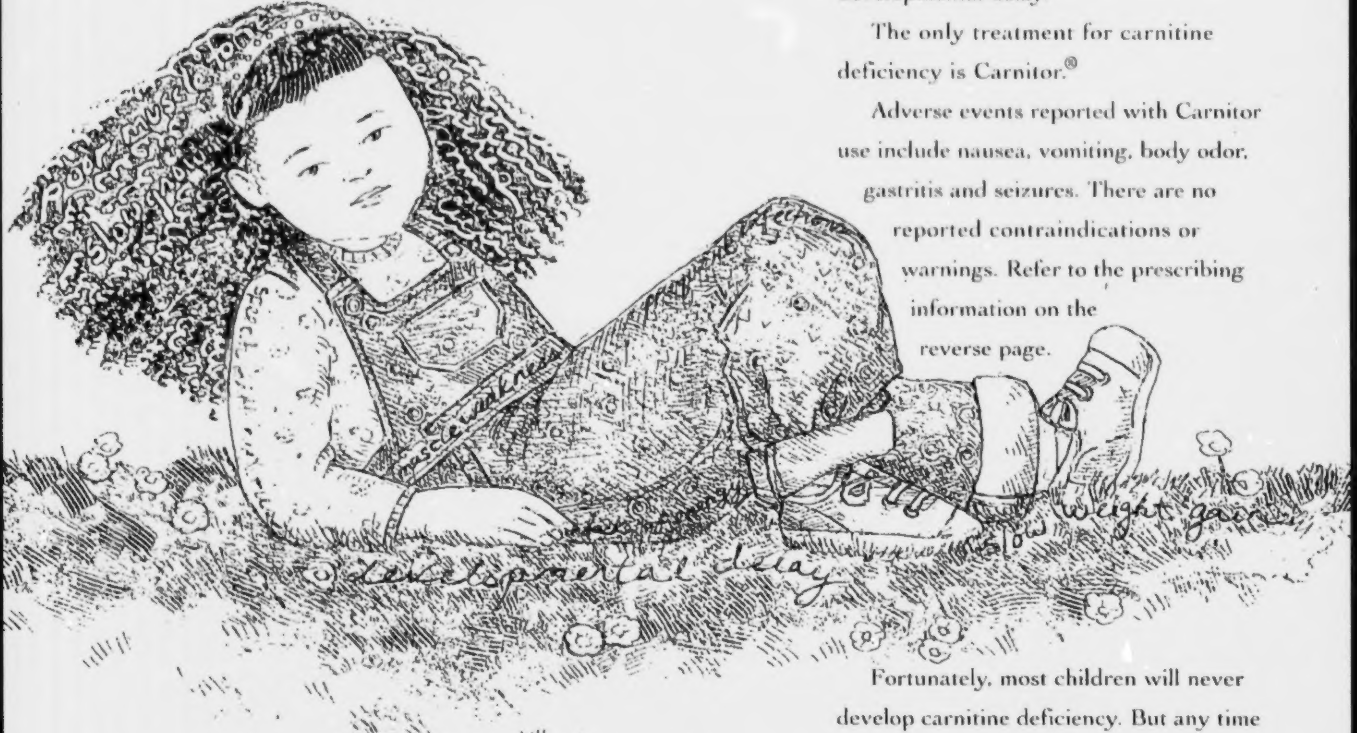
No one knows your child as well as you do. So no one's better at seeing the subtle things that affect your child's health. Things like carnitine deficiency.

Carnitine is a naturally occurring substance that's essential in the metabolic process. If the body is deficient in carnitine, the ability of the cells to produce energy and to remove toxic wastes is impaired. And while carnitine deficiency can be serious, its symptoms are hard to detect and are often overlooked.

Signs include muscle weakness, frequent infection, seizures, poor muscle tone, slow growth, speech difficulties, slow weight gain, lack of energy and developmental delay.

The only treatment for carnitine deficiency is Carnitor.®

Adverse events reported with Carnitor use include nausea, vomiting, body odor, gastritis and seizures. There are no reported contraindications or warnings. Refer to the prescribing information on the reverse page.



Fortunately, most children will never develop carnitine deficiency. But any time you notice something that seems not quite right, talk with your child's doctor. After all, only you see the whole picture.

For more information, visit www.carnitor.com. Or call 1-800-447-0169.

Carnitor®
levocarnitine
Tablets 330mg • Oral Solution 1g/10mL

Carnitor®

levocarnitine

Tablets 330mg • Oral Solution 1g/10mL

CARNITOR® (levocarnitine) Tablets (330 mg)
CARNITOR® (levocarnitine) Oral Solution (1 g/10 mL multidose)
FOR ORAL USE ONLY. Not for parenteral use. Rx only.

BRIEF SUMMARY

The following is a brief summary. Please see package insert for full prescribing information.

CLINICAL PHARMACOLOGY

CARNITOR® (levocarnitine) is a naturally occurring substance required in mammalian energy metabolism. It has been shown to facilitate long-chain fatty acid entry into cellular mitochondria, therefore delivering substrate for oxidation and subsequent energy production. Fatty acids are utilized as an energy substrate in all tissues except the brain. In skeletal and cardiac muscle they serve as major fuel. Primary systemic carnitine deficiency is characterized by low plasma, RBC, and/or tissue levels. It has not been possible to determine which symptoms are due to carnitine deficiency and which are due to the underlying organic acidemia, as symptoms of both abnormalities may be expected to improve with carnitine. The literature reports that carnitine can promote the excretion of excess organic or fatty acids in patients with defects in fatty acid metabolism and/or specific organic acidopathies that bioaccumulate acyl CoA esters.

Secondary levocarnitine deficiency can be a consequence of inborn errors of metabolism. CARNITOR® may alleviate the metabolic abnormalities of patients with inborn errors that result in accumulation of toxic organic acids. Conditions for which this effect was demonstrated are: glutaric aciduria II, methyl malonic aciduria, propionic acidemia, and medium chain fatty acyl CoA dehydrogenase deficiency. Autointoxication occurs in these patients due to the accumulations of acyl CoA compounds that disrupt intermediary metabolism. The subsequent hydrolysis of the acyl CoA compound to its free acid results in acidosis that can be life threatening. Levocarnitine clears the acyl CoA compound by formation of acyl carnitine which is quickly excreted.

Levocarnitine deficiency is defined biochemically as abnormally low plasma levels of free carnitine, (less than 20 µmol/L at one week post term) and may be associated with low tissue and/or urine levels. Further, this condition may be associated with a ratio of plasma ester/free levocarnitine levels greater than 0.4 or abnormally elevated levels of esterified levocarnitine in the urine. In premature infants and newborns, secondary deficiency is defined as plasma free levocarnitine levels below age related normal levels.

BIOAVAILABILITY/PHARMACOKINETICS

In a relative bioavailability study in 15 healthy adult male volunteers CARNITOR® Tablets were found to be bio-equivalent to CARNITOR® Oral Solution. Following the administration of 1980 mg b.i.d., the maximum plasma concentration level (C_{max}) was 80 nmol/mL and the time to maximum concentration (T_{max}) occurred at 3.3 hours. There were no significant differences for AUC and urinary excretion observed between these two formulations.

In the same bioavailability study of 15 healthy adult males, CARNITOR® (levocarnitine) Injection administered as a slow 3 minute bolus intravenous injection at a dose of 20 mg/kg showed that free levocarnitine plasma profiles are best fit by a two compartment model. Approximately 76% of free levocarnitine is eliminated in the urine. Using plasma levels uncorrected for endogenous levocarnitine, the mean distribution half life was 0.585 hours and the mean apparent terminal elimination half life was 17.4 hours following a single intravenous dose.

The absolute bioavailability of L-carnitine from CARNITOR® Tablets and Oral Solution was determined compared to the bioavailability of L-carnitine from CARNITOR® Injection Intravenous in 15 healthy male volunteers. After correction for circulating endogenous levels of L-carnitine in the plasma, absolute bioavailability was 15.1% ± 5.3% for L-carnitine from CARNITOR® Tablets and 15.9% ± 4.9% from the Oral Solution.

Total body clearance of L-carnitine (Dose/AUC including endogenous baseline levels) was a mean of 4.00 L/hr. Endogenous baseline levels were not subtracted since total body clearance of L-carnitine does not distinguish between exogenous sources of L-carnitine and endogenously synthesized L-carnitine. Volume of distribution of the intravenously administered dose above baseline endogenous levels was calculated to be a mean of 29.0 L ± 7.1 L (approximately 0.39 L/kg) which is an underestimate of the true volume of distribution since plasma L-carnitine is known to equilibrate slowly with, for instance, muscle L-carnitine.

L-carnitine was not bound to plasma protein or albumin when tested at any concentration or with any species including the human.

INDICATIONS AND USAGE

CARNITOR® (levocarnitine) is indicated in the treatment of primary systemic carnitine deficiency. In the reported cases, the clinical presentation consisted of recurrent episodes of Reye-like encephalopathy, hypoketotic hypoglycemia, and/or cardiomyopathy. Associated symptoms included hypotonia, muscle weakness and failure to thrive. A diagnosis of primary carnitine deficiency requires that serum, red cell and/or tissue carnitine levels be low and that the patient does not have a primary defect in fatty acid or organic acid oxidation (see Clinical Pharmacology). In some patients, particularly those presenting with cardiomyopathy, carnitine supplementation rapidly alleviated signs and symptoms. Treatment should include, in addition to carnitine, supportive and other therapy as indicated by the condition of the patient.

CARNITOR® (levocarnitine) is also indicated for acute and chronic treatment of patients with an inborn error of metabolism that results in a secondary carnitine deficiency.

CONTRAINDICATIONS

None known.

WARNINGS

None.

PRECAUTIONS

General

CARNITOR® (levocarnitine) Oral Solution is for oral/internal use only.

Not for parenteral use.

Gastrointestinal reactions may result from too rapid consumption of carnitine. CARNITOR® (levocarnitine) Oral Solution may be consumed alone, or dissolved in drinks or other liquid foods to reduce taste fatigue. It should be consumed slowly and doses should be spaced evenly throughout the day to maximize tolerance.

Carcinogenesis, mutagenesis, impairment of fertility

Mutagenicity tests performed in *Salmonella typhimurium*, *Saccharomyces cerevisiae*, and *Schizosaccharomyces pombe* indicate that CARNITOR® (levocarnitine) is not mutagenic. Long-term animal studies have not been conducted to evaluate the carcinogenicity of the compound.

PREGNANCY

Pregnancy Category B.

Reproductive studies have been performed in rats and rabbits at doses up to 3.8 times the human dose on the basis of surface area and have revealed no evidence of impaired fertility or harm to the fetus due to CARNITOR®. There are, however, no adequate and well controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

NURSING MOTHERS

It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

PEDIATRIC USE

See Dosage and Administration.

ADVERSE REACTIONS

Various mild gastrointestinal complaints have been reported during the long-term administration of oral L- or D,L-carnitine; these include transient nausea and vomiting, abdominal cramps, and diarrhea. Mild myasthenia has been described only in uremic patients receiving D,L-carnitine. Gastrointestinal adverse reactions with CARNITOR® (levocarnitine) Oral Solution dissolved in liquids might be avoided by a slow consumption of the solution or by a greater dilution. Decreasing the dosage often diminishes or eliminates drug-related patient body odor or gastrointestinal symptoms when present. Tolerance should be monitored very closely during the first week of administration, and after any dosage increases.

Seizures have been reported to occur in patients with or without pre-existing seizure activity receiving either oral or intravenous levocarnitine. In patients with pre-existing seizure activity, an increase in seizure frequency and/or severity has been reported.

OVERDOSAGE

There have been no reports of toxicity from carnitine overdosage. The oral LD_{50} of levocarnitine in mice is 19.2 g/kg. Carnitine may cause diarrhea. Overdosage should be treated with supportive care.

DOSAGE AND ADMINISTRATION

CARNITOR® (levocarnitine) Tablets.

Adults: The recommended oral dosage for adults is 990 mg two or three times a day using the 330 mg tablets, depending on clinical response.

Infants and children: The recommended oral dosage for infants and children is between 50 and 100 mg/kg/day in divided doses, with a maximum of 3 g/day. Dosage should begin at 50 mg/kg/day. The exact dosage will depend on clinical response.

Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution.
For oral use only. **Not for parenteral use.**

Adults: The recommended dosage of levocarnitine is 1 to 3 g/day for a 50 kg subject, which is equivalent to 10 to 30 mL/day of CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 1 g/day, (10 mL/day), and be increased slowly while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

Infants and children: The recommended dosage of levocarnitine is 50 to 100 mg/kg/day which is equivalent to 0.5 mL/kg/day CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 50 mg/kg/day, and be increased slowly to a maximum of 3 g/day (30 mL/day) while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution may be consumed alone or dissolved in drink or other liquid food. Doses should be spaced evenly throughout the day (every three or four hours) preferably during or following meals and should be consumed slowly in order to maximize tolerance.

OBS-2
2/00

All children should be seen. And heard.

With free Verizon assistive equipment, the lines of communication are open to children with disabilities.

If you're the parent of a child with a disability, you know that talking on the phone is just as important to him as it is to every other child. Which is why, if your child qualifies, you should apply for free assistive equipment from Verizon. To qualify, your child must be under 18 and have a certified disability that hinders him (or her) from using the phone, and receive SSI disability benefits.

The equipment covers the range from TTYs and volume-amplified telephones to light signalers, loud tone ringers, and large-number and hands-free telephones.

As you already know, every child has something to say. Now yours can say it on the phone much easier than before. **For recorded information about the program or to request an application, call 1 800 882-6828 (V) 1 800 299-2640 (TTY)**

This is a limited time offer and applies only to New York State Verizon customers or their dependents living in the same household, for as long as our supply of this equipment lasts.

EDENSOY
ORGANIC SOYMILK
EDEN.
33.8 FL OZ (1.06 QT) 1 LITER
peace of mind

A Great Idea, Made the Right Way

EDENSOY® provides up to 11 grams of soy protein per serving (twice that of most soymilk) so it's easy to get the FDA suggested 25 grams per day for heart health. Made of whole food ingredients like organic non-genetically engineered bean and grain; EDENSOY has absolutely no refined sugar, undeclared soy isolate or flavor masking ingredients, with 5.67% more than a quart in our liter. America's first soymilk and still the best, EDENSOY.

At a Nurses' Station at Great Ormond Street

They say a picture is worth a thousand words, and that's what I am normally allotted for my monthly *Editor's Desk*. When I was a med student, I did a rotation at London's famed Hospital for Sick Children at Great Ormond Street. At one of the nurses' stations, where the students would stock up on Cadbury's chocolate taken from patients' rooms and read charts, there was a crude wood sign with the quote that appears below. It is, in essence, this month's Editor's Desk. On the last day of my rotation I scribbled it down on the back of a wrapper from a Fruit and Nut Bar, and have kept it ever since. EP Magazine has provided this picture for you with our compliments. It's suitable for framing, or tearing out and mailing to your doctor a week before your next visit. EP

About Search & Respond

Search and Respond is an opportunity for our readers to exchange information about their practical experiences in meeting the everyday challenges of life with a child or adolescent who has a disability. In this column, "S" represents Search letters and "R" represents Respond letters received about a previously printed Search. "Instant S&R" is a new feature which represents e-correspondence we have downloaded from our Web site. All Responds are forwarded to the writers of the original Searches; some are published. Published letters may be edited for purposes of space and clarity. We also expect parents to consult appropriate professionals.

When sending correspondence, please indicate whether it is a Search or a Respond. For Responds, be sure to note in which issue the original Search letter appeared. Please remember to include a phone number on all correspondence, in the event that more information is required. Write to: Exceptional Parent, Attn.: Search/Respond, 65 East Route 4, River Edge, NJ 07661; Fax to: (201) 489-0074; e-mail to epedit@aol.com; or visit Search & Respond on our Web site: http://www.eparent.com.

For information about specific disabilities, contact: the National Organization for Rare Disorders (NORD), 100 Rt. 37, PO Box 8923, New Fairfield, CT 06812; (800) 999-6673; (203) 746-6518; Web site: http://www.rarediseases.org. Also, see the "National Resources for Specific Disabilities" directory in Exceptional Parent's 2002 Resource Guide (January 2002, starting on page 22).

Each month, Chris Feudtner, MD, PhD, reviews Search & Respond for accuracy and completeness. Dr. Feudtner is a pediatrician at the Pediatric Care Center of the University of Washington in Seattle. Look for Dr. Feudtner's comments on certain Search & Respond letters.

S

Visual Learning Disability

My son was just diagnosed with a visual learning disability. I was told that he has a problem "processing" the information he is receiving visually. He is 4 1/2 years old and attends a regular preschool. His teacher noticed that he was not retaining things that were being taught visually (alphabet, numbers, etc.). He is extremely bright and thinks on an abstract level which is why the teacher became suspicious. Can anyone tell me what is in store? What therapy or strategies might we try to help him compensate? Any advice would be helpful.

—123 Via EP web site

R

I'm a parent advocate specializing in educational law. I would suggest that you look into several things: 1. Ask for a very clear definition of visual processing disability. The label is not enough information to lead you to the treatments that will be necessary. For example, is it a problem of visual discrimination, visual sequencing, visual memory? Each is different regarding the process that information must go through when it enters the brain. 2. Do you know if your child has visual acuity problems? 3. Find out if your son's auditory processing is intact. If so, you can use that route of input to help him build visual processing. For example, try singing the ABCs to add auditory input while he is looking at the letters. 4. Ask for special education services (ultimately an IEP). Make sure that your son receives school-based accommodations, modifications and specially designed instruction at no cost to you. 5. Ask for multi-sensory instruction.

—Hope, iepvic@aol.com,
Via EP Web site

Abbreviations Used in this Month's S&R:

- GI = gastrointestinal (esophagus, stomach, small and large bowels)
- G-tube or GT = gastrostomy feeding tube, inserted through the skin into the stomach
- IEP = individual educational plan

S

Pelizaeus-Merzbacher, Gastrostomy Tube, and Quality of Life

We have a 2-year-old son who has been presumptively diagnosed with Pelizaeus-Merzbacher brain sclerosis (a progressive disease of the central nervous system affecting the brain's white matter). He is experiencing severe developmental delays (does not hold up his head) and feeding issues stemming from his hypotonia, along with congenital nystagmus. He is failing to thrive, weighing in at 18 pounds and measuring 30 inches. We are currently in the hospital for pyloroplasty surgery (to amend delayed gastric emptying) and the placement of a g-tube. We are not familiar with the quality of life and the potential we can expect him to display. We are certainly interested in providing him every opportunity to excel. We are looking for anyone else who has this disease, any information that can be provided about the surgeries mentioned, and therapies, activities, facilities or toys which can help us give him what he needs and deserves.

—Jennifer Seman,
semanalex@aol.com, Via EP Web site

R

My son is 25 and has had a g-tube since he was 8. I have worked in special education for 13 years and have had a number of students with g-tubes and three godchildren with them also. At the point of having a surgery done, my first rec-

Continued from page 12

ommendation is to make sure an emptying study is done, in the event that a g-tube fails. At the same time, a pyloroplasty may be done if needed. Next, after some healing has taken place (usually a Foley tube is inserted with the surgery) use a MicKey g-tube, it is much easier and will not tangle as much.

I am surprised at the number of doctors I have met unfamiliar with these products and their use, even those who specialize in gastrointestinal procedures. We have to stay on top of new items and maintenance techniques. I have had to learn through trial and error. But Jason is healthy and a g-tube has been one of his best quality-of-life procedures. He can still eat and enjoy all of the good stuff by mouth, while medications and nutrition are taken care of via his g-tube. He also enjoys sleeping in for breakfast and gets breakfast in bed. Also, the g-tube is a blessing on trips, since we can now feed him in the car while going down the road. All this, and choking and aspiration have been minimized, too.

—Debra Marasco-McNulty
via EP Web site

Editor's Note: You might also want to visit the Pelizaeus-Merzbacher Disease Foundation Web site, and particularly their parent page, at http://www.pmdfoundation.org.

Information About Children with Tracheotomies

I would like to see more information about children with tracheotomies. There are many reasons why children have trachs, but trach care is basically the same for all. I don't know whether there is a national support group, which would be very helpful to many families.

—152 via EP web site

There is a web site devoted to children with tracheotomies, at http://tracheostomy.com. This site is a wealth of information! There is a link on that page to "Kids with Tracheostomies," with many photos and stories. My daughter is on Page 2, Clara Grace Chilton, though her story is very out-of-date. She is now 4 years old, has already had her heart surgery, and still has her trach. There is also a "networking" link that lists several e-mail lists that you can join along with chat rooms or message boards. Good luck!

—1170 via EPWeb site

Editor's Note: The terms "tracheostomy" and "tracheotomy" are often used interchangeably, and, although the technical differences between the two are not really that important, most children have tracheotomies.

Search

Partial Trisomy 7q

A friend of mine has an 8-month-old daughter who has been diagnosed with partial trisomy 7q. My friend has been unable to find any information or support pertaining to this specific disorder. She would especially love the chance to talk with some "been there, done that" parents.

—141 via EP Web site

Lung Problem

My 3-year-old was diagnosed with bronchitis three weeks ago. He didn't respond well to treatment, so we did a chest X-ray. He has pneumonia and the doctor says he has asthma, too. He had pneumonia when he was 16-months-old (possibly for some time before that). It was accidentally found during an upper GI test to follow up on his gastroesophageal reflux. It took many bottles of antibiotics to clear up that infection. It seems like his lungs are just taking a beating. Could there be another underlying problem that could be causing all of his colds, bronchitis, pneumonia, etc.? He seems to have had trouble breathing and growing from birth. I really worry about his lack of immunity to illnesses.

—130 Via EP web site

Childcare

We are the parents of a 14-month-old girl with global developmental delay, seizure disorder and feeding issues (all liquids through g-tube). We are having a tough time finding appropriate child care for her and prefer in-home care. We have already been through one nanny who took advantage of her special needs by ignoring her (much to our horror and dismay). We have cobbled together care from friends and have a temporary nanny. I am told we do not qualify for any benefits to aid in deferring the cost of the care. In addition, how do we find the right kind of committed individual? Both my husband and I must work. Any suggestions (especially from those of you in Pennsylvania)?

—Molly Watson, via EP Web site

Editor's Note: Medicaid waivers exists in some states which can help parents care for their child at home. Parent Training and Information centers (PTIs) can provide information on those programs. For PTIs in each state, contact the PACER Center (888) 248-0822. In Pennsylvania, contact the Parent Education Network (800) 522-5827 to find out if your family can qualify for the waiver.

Selective Neurectomy

Our 5-year-old son has spastic cerebral palsy. He has been evaluated for selective dorsal rhizotomy and found not to be a good candidate. The doctor has discussed the possibility of a selective neurectomy. Has anyone had this done on their child, and what were the results, esp. in terms of a reduction in tone and an increase in their ability to perform activities of daily living?

-Cathy Buckley, Floral Park, N.Y

Respond

Difficulty with Gastrostomy Tube

In the February 2000 issue, SH has a 7-year-old grandchild who had discomfort and other problems with his gastrostomy tube (GT), which needs continuous venting.

We have had many feeding difficulties and have tried many things to help our son stay vented, especially during therapies. Our surgeon came across a new product that has been wonderful. The bags will fit any feeding method. It is called a Farrell Valve System for external gastric pressure relief. We were the first to use these at our children's hospital. We call them burp bags. These are made by Corpak MedSystems, Inc ([800] 323-6305). We were unable to get our insurance to pay for this new product initially but now they are being covered. Our GI specialist was not familiar with them but is now using them successfully with other children.

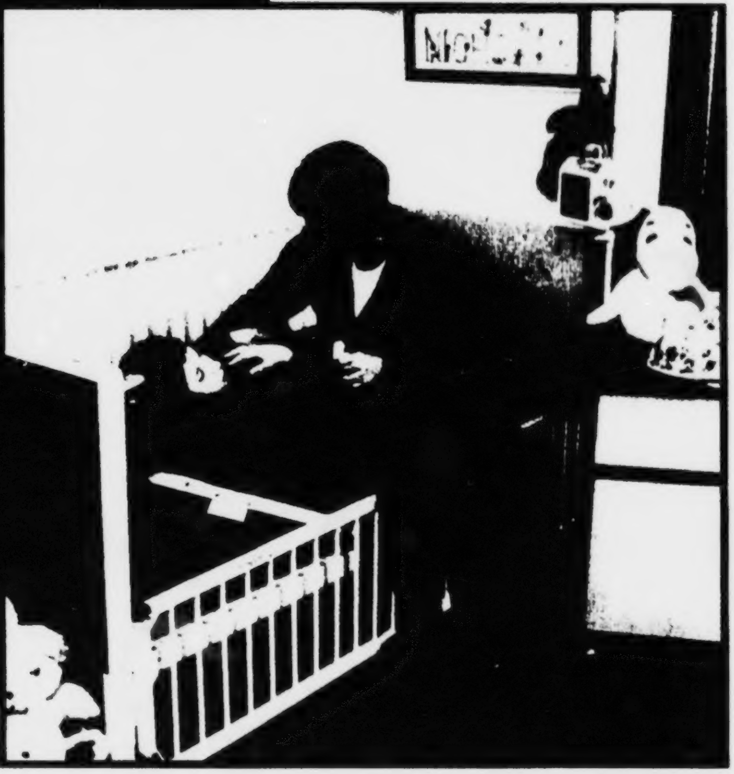
HARD MANUFACTURING

AGE APPROPRIATE BEDS

For when your child passes the crib stage!



Dianna Fitzgerald
& Her Son Nicholas

Beds for children once they pass the crib stage are always an issue with parents... I can't begin to tell you how terrific the people at HARD Mfg. are. Mary Bias, the rep for the Indiana area told me she knew exactly what I wanted and needed for Nicholas. Thirty-days later the Stockton Bed arrived and it couldn't be more perfect! The Stockton comes in three sizes, with crib type rails, and a height adjustment up to 34"... saving my back! It even has a mounted IV pole for Nicholas' feeding pump. Mary had also suggested the white bed with a red outer footboard and yellow inner headboard...

It truly is the best investment we ever made.

The Stockton features full crib safety sides

Thank You HARD!
Dianna Fitzgerald

- HARD "Age Appropriate" Beds accommodate your child with the safety and convenience you would expect from the nation's #1 manufacturer of hospital cribs and youth beds.
- Available in a rainbow of colorful epoxy finishes and laminate colors to match your room decor.
- Hi-Lo adjustment for convenience and safety.
- Attains all orthopedic and comfort positions.
- Currently available in custom sizes to accommodate all ages.
- Crib type safety sides are close to the mattress to protect arms & legs.

For information about our full line of beds and cribs,
as well as locating your nearest HARD dealer, please give me a call.

Issues and Trends

in Treatment of Children with Autism Spectrum Disorders

By Betsy Weaver, EdD, with Miranda Hersey

Autism and its associated spectrum of disorders are severe disorders of communication and social relatedness. It is estimated that more than two out of every 1,000 children in the United States are affected by autism or autism spectrum disorders (ASD), and, according to a recent study by the Centers for Disease Control and Prevention (CDC), that number may be as high as six per 1,000. This means there are at least 1.5 million children and adults with autism in America, making it one of the country's most common developmental disabilities.

Our understanding of these disorders has changed radically over the past few years and has attracted media attention. The changes include a redefinition of the disorder, a measurable rise in prevalence and breakthroughs in treatment. There is a new emphasis on early diagnosis and intensive intervention, both of which can markedly change outcomes. Other recent issues include the availability of qualified therapists and the scrutiny of treatment cost and concentration.

Despite the increase in media interest and the expansion of treatment options, there are few information resources for families needing help with the ASD treatment process. Parents and children navigating treatment decisions are faced with conflicting information, sometimes controversial therapies, and the lack of specialized therapists and support networks. When these hurdles are overcome, however, and appropriate therapy is carried out, treatment is more likely to have a positive outcome.

> **...in addition to figuring out what is best for the child, keep in mind what will work best for you as parents as well.**

Earlier diagnosis

Treatment options for ASD have evolved significantly in a relatively short amount of time. Only 20 years ago, the vast majority of people with autism were eventually institutionalized. For decades, autism was treated with psychoanalysis. Today, ASD is commonly regarded as a neurobiological disorder and treatment is based on behavioral, cognitive-developmental and medical research findings.

Diagnosing children at younger ages is an important factor in the proliferation of treatment options. In the past, children with autism spectrum disorders were diagnosed when they were between 5 and 10 years of age; treatment programs were less refined and less effective. Reaching these children earlier, at 24 to 36 months old, increases treatment effectiveness.

In July 2001, the Committee on Educational Interventions for Children with Autism (CEICA) issued a report outlining an interdisciplinary approach to education for children with autism called Educating Children with Autism (ECA), which can be read at http://www.nap.edu. Catherine Lord, PhD, professor of psychology at the University of Michigan and director of the university's Autism and Communication Disorders Center, heads CEICA. "Autism affects very basic aspects of social development and communication," says Lord. "Therefore, early intervention may help prevent the development of more severe problems, a common occurrence which begins when a child participates in early and minimal social relations. Consequently, the press for early recognition and intervention can be likened to the need for early screening for visual or hearing impairments—but instead of getting a child glasses or a hearing aid, what we're trying to do is give children with ASD intense, positive social and communicative experiences that allow them to learn and develop as well as possible. It wouldn't be accurate to say that there's a true critical period or one correct treatment. We're trying to provide kids with 'social scaffolding' to learn as other children do."

Which approach to use?

Of the numerous treatment approaches currently practiced, some of the most well known include: applied behavioral analysis

(ABA); treatment and education of autistic and related communication handicapped children (TEACCH); and the developmental, individual-difference, relationship-based (DIR) approach, often described as Floortime or the Greenspan approach. Each of these methods has documented success through case reports or research. Most programs are highly structured and individualized.

Nancy Wiseman is president of First Signs, the nonprofit organization she founded to educate physicians and parents on the early warning signs of autism and other developmental disabilities. Her daughter Sarah has ASD. Wiseman suggests that a parent's first step in the treatment process is to evaluate which particular methodology is most appropriate, with as much professional insight as possible. "Deciding which treatment or combination of treatments is best for your child depends upon the child's needs, what you can find nearby, what will be supported by those who will fund the treatment, and what feels best to you as a family. Keep in mind that no matter what anyone suggests, there is no single best approach."

Another criterion for making this decision is the level of parental involvement in treatment. As reported in ECA, "Nearly all empirically-supported treatments…include a parent component and most research programs used a parent-training approach." Therefore, in addition to figuring out what is best for the child, keep in mind what will work best for you as parents as well.

> **A surge of uncertainty goes through your head frequently when you have a child with complex problems, but you can't help your child if you are overwhelmed.**

What next?

The next step is to determine the source of funding for treatment and to resolve what other ancillary support or treatments the child needs. There are a host of therapeutic, biomedical and support services that your child may need in concert with the overall intervention approach, such as occupational therapy (OT), physical therapy (PT), speech and language therapy, play therapy, social skills groups, auditory integration therapy, Picture Exchange Communications Systems (PECS), nutritional or dietary interventions. Depending upon your child's age, some of these services may be provided by an early intervention program, for children under 3 years old, or by the public school special education department for children 3 years of age or older. Complementary therapies may or may not be part of your child's program. For children under 3-years-old, early intervention programs generally include OT, PT, speech, PECs, and social skills groups. "Additionally, you may want to consider some local community programs that provide an opportunity for social interaction, like a playgroup, sports activity or art class," Wiseman notes.

Who helps make these decisions?

Many families are daunted by the decision-making process. It is therefore key to assemble as strong a team of professionals and support network as possible. Finding professionals you can trust is paramount, Wiseman suggests. "You want people who will see your child as an individual; people who will advocate for programs to meet particular needs rather than taking a cookie-cutter approach."

It is extremely useful to have one professional on your team act as the family/child service coordinator. The specialist who diagnosed your child can often take this role, or perhaps your pediatrician or trusting educator. It's critical to involve someone who knows your child well, can act as a liaison and, equally important, be a support to you and your family. You are your child's best advocate, but you also need time to be a parent to your child and designate someone else to coordinate the complexities of a program with multiple components and service providers. When it's not possible to find a coordinator – which happens all too often, especially in areas with limited treatment resources – coordination falls to a parent. In these cases, the parent needs as much personal support as possible.

The updated Individuals with Disabilities Education Act (IDEA '97) mandates family supports and service coordination for families of children under the age of 3 with disabilities. Educating Children with Autism recommends that this coordination support be extended to children through age 8.

Shortage of qualified providers

"Personnel preparation remains one of the weakest elements of effective programming for children with autistic spectrum disorders and their families.…Ways of building on the knowledge of teachers as they acquire experience with autistic spectrum disorder, and ways of keeping skilled personnel within the field, are critical," reports ECA.

Particularly with young children, ASD treatments are intensive and often require many hours per week in one-on-one sessions. Lord explains, "In our report, we recommended 25 hours of planned intervention per week, which would include some one-on-one treatment in most cases, but also, depending on the needs of the child, could include participation in different therapies or educational programs. Some children, however, may need even more hours of individual or group treatments, again

Resources and Organizations

TASH (The Association of Persons with Severe Handicaps)
http://www.tash.org/
29 West Susquehanna Ave., suite 210
Baltimore, MD 21204
410-828-8274
Advocacy group that works toward school and community inclusion of children and adults with disabilities. Provides information and referrals for services, publishes a newsletter and journal.

The Autism National Committee
http://www.autcom.org/
437 Elm St.
Kingston MA 02364-1805
Contact: Roz Forsyth
781-585-0903
Organization for the protection and advancement of the human rights and civil rights of all persons with autism and related differences of communication and behavior. Publishes *The Communicator*, provides referrals, and sponsors an annual conference.

Autism Research Institute
http://www.autism.com/ari/
4182 Adams Ave.
San Diego, CA 92116
619-281-7165
Publishes quarterly journal, *Autism Research Review International*. Provides up-to-date information on current research.

Autism Society of America, Inc.
http://www.autism-society.org/
301-657-0881 or 800-3-AUTISM
Provides a wide range of services and information to families and educators. Organizes a national conference. Publishes *The Advocate*, with articles by parents and autism experts. Local chapters make referrals to regional programs and services, and sponsor parent support groups. Offers information on educating children with autism, including a bibliography of instructional materials for and about children with special needs.

Centers for Disease Control and Prevention
http://www.cdc.gov/ncbddd/dd/ddautism.htm
770-488-7150
The National Center on Birth Defects and Developmental Disabilities (NCBDDD) at the CDC seeks to promote optimal fetal, infant, and child development; prevent birth defects and childhood developmental disabilities; and enhance the quality of life and prevent secondary conditions among children, adolescents, and adults who have a disability.

The Council for Exceptional Children
http://www.cec.sped.org/
1110 North Glebe Rd., suite 300
Arlington, VA 22201
888-CEC-SPED
Professional organization dedicated to improving educational outcomes for individuals with exceptionalities, students with disabilities, and/or the gifted.

Cure Autism Now (CAN)

depending on their needs and their families' situations."

Finding treatment and qualified personnel who are appropriately trained is challenging. Currently there is a shortage of qualified personnel in all categories. "We are constantly recruiting those who are experienced and trained in ABA," says Pia Durkin, PhD, director of special education for the Boston public schools. "We have great teachers, but finding the therapeutic staff—even aides or assistants—takes time and effort. We are keeping pace at the moment. There is clearly a shortage, but we're lucky; we have been able to meet our need. We are always looking and working on the staffing piece."

Meeting high service demands by providing enough qualified professionals is key to further success in ASD treatment. "One of the most important recommendations in this report was for the federal Office of Special Education Programs (OSEP) to establish a five-year plan. One of our top priorities is funding for the professional development of teachers, paraprofessionals and other personnel for children with ASD," explains Gail Houle, PhD, associate division director of the Research to Practice Division within OSEP.

Families, school systems and experts across the country all worry about the challenge of attracting, training and keeping professionals in this field. "While we are working on many of the recommendations from this report, we are implementing this one immediately and will be working to strengthen this area of our delivery system right away," says Houle.

"Am I doing enough?"

In addition to worrying about the logistics of treatment, parents may be plagued by the stress of keeping their family together. A surge of uncertainty goes through your head frequently when you have a child with complex problems, but you can't help your child if you are overwhelmed. Take a breath. "Realize you can't do it all at once," advises Wiseman. "Parents need help finding balance." The experts suggest setting priorities and focusing on a few items that your child needs now work the best. "Otherwise, you are layering emotional traumas onto an already complex situation for your child and yourself," Wiseman adds.

Staff, time, dollar gaps

Tremendous strides have been made in the past decades for children with autism spectrum disorders. We are diagnosing ASD at younger ages and providing better treatment earlier. From federal and state governments to directors of special education, the capacity to serve these children is growing and strengthening. These improvements give children with ASD a

> "Studies show that individuals with autism respond well to a highly structured, specialized education program tailored to their individual needs. A well-designed intervention approach may include some elements of communication therapy, social skill development, sensory integration therapy and applied behavior analysis, delivered by trained professionals in a consistent, comprehensive and coordinated manner. The more severe challenges of some children with autism may be best addressed by a structured education and behavior program which contains a one-on-one teacher-to-student ratio or small group environment. However, many other children with autism may be successful in a fully inclusive general education environment with appropriate support."

continued from page 23

better chance to reach their potential.

There are still critical challenges to address, though. They can be summed up in three words: staff, time and dollars. The cost of these programs is enormous, particularly when individualized instruction and treatment are vital. A comprehensive program ranges from 12 to 40 hours per week, including other support services that might be necessary. In a private setting, ABA, for example, can cost more than $40,000 per year. Even in public schools or home-based programs, individual therapies are often recommended for 40 hours per week.

Lord acknowledges that 25 hours of therapy per week is intense for the patient as well as the staff. The benefits of these therapies, however, far outweigh the costs. "Everyone wants the dramatic results that time-intense treatment can achieve," says Lord. "Naturally, parents want what appears to be best for their children." Given that the prevalence of ASD seems to be increasing, and that rise increases the cost of these programs, Lord notes the growing burden for schools, early intervention programs and families, who often must supplement what is offered. "This is a tough situation for all, particularly when families perceive there is only one way to proceed. That is why we have to consider all available treatment alternatives—and be willing to try new techniques as well."

Durkin agrees. "Sometimes in public schools we feel we're in a no-win situation. We offer great programs now, but often these programs are rebuffed by families who have been told they need or should expect something outside the public sector, something different or something more. This may be a result of school systems being less than forthcoming or responsive to families with children with ASD. But in Boston that is changing, and we need to work with families to get them to trust us, try what we offer and tell us how we may need to change."

Given the committee's report, help is on the way. As Lord and Houle attest, these issues have been identified; the concerns have been raised and recommendations made to address them. Lord, Houle and other professionals are now prioritizing the agenda for autism at the federal level. We all await the result of these efforts. EP

With the Creepster Crawler, You Can Watch Your Child Crawl for the First Time!

Children lacking head control, the ability to roll over or belly crawl have gained mobility with the ***Creepster Crawler.*** Using this light, innovative device, hundreds of children around the world are crawling, working more productively with their therapists, and gaining a head start to more advanced mobility in the future.

The ***Creepster Crawler*** is an ideal solution for youngsters with debilitating conditions such as ☐ Spina Bifida ☐ Down Syndrome ☐ Cerebral Palsy ☐ TBI, and ☐ developmental delays. Children with tracheostomies and G-Tubes also are successful users of the ***Creepster Crawler***.

The ***Creepster Crawler***'s frame has a padded platform that can support a parent or therapist from above, making it easier to work with the child on weight-bearing, weight-shifting, reaching and creeping. Front shoulder, chest and rear straps can be adjusted for individual fit.

Pedaling with Pete:

One Man's Journey to Raise Awareness About Cerebral Palsy

by Anne Kirkland

In 1989 Pete Zeidner decided he would make a difference. From birth he had battled cerebral palsy to live independently. With the help of two strong and supportive parents and an extraordinary determination and belief in himself, he had succeeded to a remarkable degree. He attended regular schools from seventh grade on and graduated from Kent State University in 1986. But a college education didn't open the doors that Pete hoped it would. Though he went on countless interviews, he always seemed to come up empty-handed. Understandably, he became extremely angry and frustrated and suspected that, due to his disability, no one would give him the opportunity to use what he had learned in college. Then one day he decided enough was enough. He decided to do something with his life and succeed, even if it didn't involve his degree in marketing.

A cycling enthusiast, Pete decided he would raise money for cerebral palsy research by pedaling his custom-built, specially adapted recumbent bike 1,000 miles around the entire perimeter of Ohio. "I believe that anger and frustration are two driving forces in my life, and they can be put to good use in the proper situations," Pete says today. "I was hearing about all of this research being conducted for other conditions like Alzheimer's disease, but I never heard about any research for CP. I decided that was where I could make a difference."

Pete's 28-day ride was so successful at raising awareness—and dollars to fund research—that two years later he started the Pedal

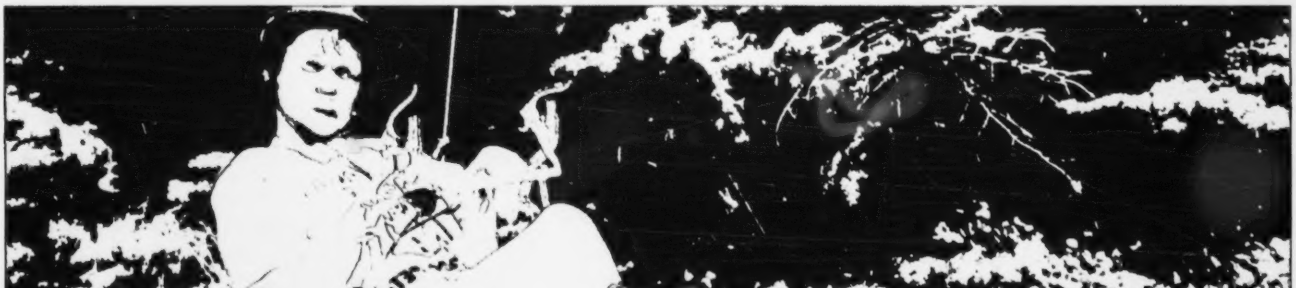

Photo credit: ©Matt Keller/Sage Design Group (http://www.sagedg.com)

with Pete Foundation. Through annual bike-a-thons and other fundraising events, Pete's foundation has to date raised more than $80,000—all for the prevention, treatment and cure of cerebral palsy. No small accomplishment for a first-generation American who has faced more than his share of reversals in his 43 years.

Two Strong Parents

Pete was born in Cleveland in 1958 to parents who immigrated to the US. At first he was not expected to live because of his cerebral palsy. Then, at the age of 4, life dealt him a second cruel blow. His mother was killed in a car accident. When his father Otmar, a physician, remarried, Pete gained a new mother in Haide Zeidner, the person he credits with turning his life around. Refusing to let pity ruin Pete's chances in life, Haide (pronounced HI-dee) chose tough love instead. When Pete was 5, she weaned him off his baby bottle, toilet-trained him and helped him learn to feed and dress himself.

When asked how she had the wisdom not to coddle Pete, Haide answers modestly, crediting her youth and inexperience more than any special insights. It also helped, she says, that, being a stepmother, she didn't experience the guilt that often hampers a biological parent raising a child with disabilities. Instead, she realized that Pete would have to work harder all his life in order to keep up with the rest of the world. Whether or not she made it easy for him now, no one would make it easy for him later.

Today, Pete's praise for Haide is unequivocal. "She accepted me unconditionally as her son, and, although she was very strict with me most of the time, and I hated her for it then, I now realize that she did a great thing for me. I have a lot of inner strength and faith in myself because of Haide's strong belief in tough love."

If Haide was the major influence in his life, Pete also found a strong role model in his father. "As I look back on his life (he passed away in June 2000), I find that he was a very courageous, compassionate and dedicated man. Throughout my father's 81 years, he was the classic example of courage and determination. He loved photography, skiing, hiking and mountain climbing. I especially loved the stories he would tell us about climbing the Alps with my oldest brother, Chris."

With obvious pride, Pete recounts how his father came to the US from Vienna, Austria with a medical degree, a wife and two small children, and worked as an orderly in a New Jersey hospital until he learned English. The year Pete was born, Dr. Zeidner established his own practice in Ohio, the first state that allowed him to take the medical board exam. "What made his practice so successful was his fluency in four languages. He was able to relate to and communicate with a wide percentage of the population."

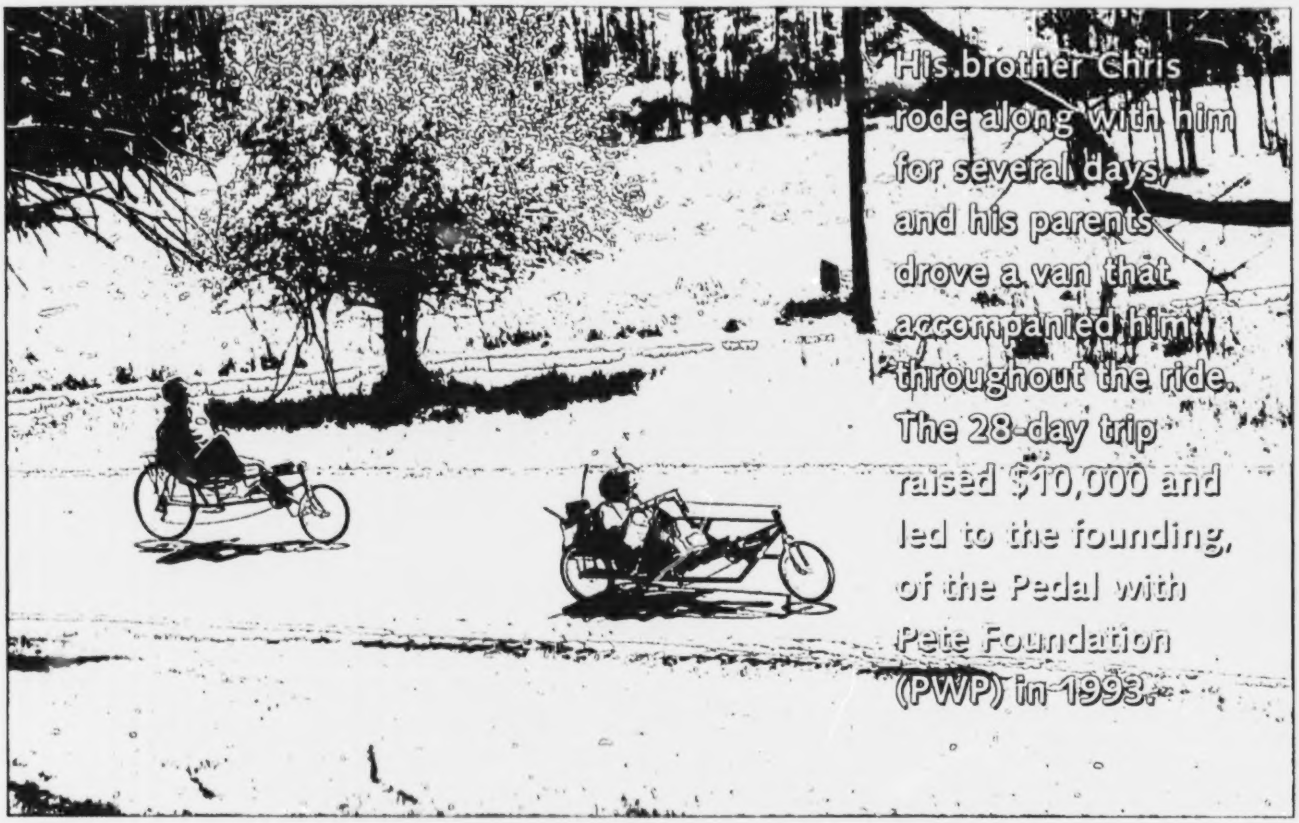
> **Through annual bike-a-thons and other fundraising events, Pete's foundation has to date raised more than $80,000 all for the prevention, treatment and cure of cerebral palsy.**

Though Haide and Otmar didn't always agree on what was best for Pete, they did everything in their power to help him realize his potential. When Pete was in the second grade, they removed him from the special classes he attended at the local elementary school and started him on an intensive exercise program Haide had read about in *Reader's Digest*. The program was based on the philosophy that in order to learn to walk, a child must first learn to crawl. "The program was intended to promote normal development in undamaged areas of the brain and reprogram damaged areas to promote normalcy," Pete explains. "The exercise regimen consisted of crawling and creeping, and swinging on monkey bars."

Some of Pete's most vivid childhood memories involve these grueling workouts. His daily exercises began at 7 AM and lasted 11 or 12 hours, seven days a week. "I was given one or two

continued on page 28

427



His brother Chris rode along with him for several days, and his parents drove a van that accompanied him throughout the ride. The 28-day trip raised $10,000 and led to the founding, of the Pedal with Pete Foundation (PWP) in 1993.

continued from page 27

hours a day for the purpose of home schooling, which I received through an outside tutor," he recalls. Family members also participated in the lengthy exercises, manipulating Pete's head, arms and legs in a series of repetitive motions to simulate normal movement.

Although the American Academy of Pediatrics later issued concerns about the effectiveness of that program, Haide says that for Peter it proved beneficial. She noticed an immediately improvement in his health. Where he had once suffered colds from September to May, he soon became the healthiest member of the family. The rigorous program also had a further benefit. It prepared him to live an independent life.

Proving He Belonged

By seventh grade, Pete could walk well enough to enter a parochial middle school, St. Mark Lutheran School in Cleveland. Though Pete was the only student with a disability in the school, Haide recalls that he was thrilled to be there.

Pete remembers how he made it a positive experience. "In the beginning I felt like I had to prove to them that I deserved to be there and, therefore, I believed that I had to give 200 percent. But it wasn't long before I made many friends. I felt like I fit right in among the other students. I realized that people could look at me and see Peter, not the 'kid with the disability.'"

Along with hard work, he also discovered the value of humor, especially in dealing with embarrassing situations: "If I tripped and fell in the hallway and someone became nervous or upset to see me fall, my friends and I would lighten the situation with a big laugh and say 'I'm just taking a nap,' or 'I thought I saw an M&M down here and I love chocolate.'"

Pete's school experience was so successful that in 1974, Lutheran High School West accepted him on a trial basis. Like most teenagers, he went through a rebellious phase. But he also found his disability to be harder to laugh off than it had been in middle school: "I had a lot of anger and frustration built up inside of me," he recalls. "Although I had many friends that accepted me as I was, I was angry with myself for not being able to do more. I took a lot of my frustration out on my younger siblings, especially when they went out with their friends and I was told I couldn't go along."

Frustrated by his inability to drive or to participate in the new independence his friends enjoyed, he rebelled against the rigors of his exercise program, which, at the insistence of his parents, had continued uninterrupted for ten long years. Stressful times followed as Haide tried to take him in hand. She now believes that the family was too fanatical about the program, saying, "You get hung up on all the things you want for your kids and don't concentrate on enjoying the positive."

So, when Pete turned 18, it was Haide who decided to stop pushing him. With her youngest child, Pete's stepsister, entering first grade, Haide decided to go back to college to pursue a degree in special education. She was not too busy, however, to advise Pete when he was at loose ends after graduating from high school. Although college was not a given for a student with a physical disability, Haide encouraged Pete to take telecourses through the local community college. Later, he attended regular classes at the college and eventually enrolled in Kent State University.

Living on his own at KSU was a big adjustment for Pete. He was very unhappy his first year and wanted to come home every weekend. He might have come home weekends, then never gone back were it not for the fact that Haide once again got tough with him. This time, she had to get tough with the entire family, who believed she was being too hard on Pete. Haide reasoned that if Pete didn't spend at least some of his weekends at school, he would never get used to the social life or learn to make friends. It was a hard battle. "Pete became depressed," she says. "At one point, he even drove his wheelchair down a flight of stairs. He was doing things to sabotage himself. He tried to give up completely but I wouldn't let him. Then, after the first year, he didn't want to come home at all."

True to form, Pete began to make friends and even joined a fraternity. He also got his first computer, which proved to be a lifesaver. It gave him a lot of independence and confidence since he had learned to type back in the second grade, when he used the eraser end of a pencil to punch the keys.

Biking Equals Independence

Pete has always been attracted to tools that augment independence. His attraction to bicycles and the freedom of movement they offered came early. Before he was even out of diapers, he would ride his tricycle around the basement. At 13, to celebrate his church confirmation, his parents gave him an adult-sized trike. "The kind the old folks in Florida ride around on," Pete says with a grin. But because the Zeidners lived in the country, where the highways were busy, Pete was only permitted to ride it in the driveway, so he would simply ride the trike in circles in front of the garage."

It wasn't until Pete was 31 that he got his first heady taste of the freedom biking could offer. His professional business fraternity, Delta Sigma Pi, helped him raise money to buy a custom-built, 36-speed, three-wheel recumbent bike (see sidebar). "I remember riding my recumbent for the first time through the streets of Kent, Ohio, and the ultimate glee that I felt," he recalls. "Maybe it was also the first time that I was able to get up in the morning, take a look at the day outside, and, if the mood struck me, I could get on my bike and go visiting." He would bike to Haide's house or his brother Steffan's—both 60-mile trips each way. Biking gave him the feeling of independence he craved. "I didn't need to rely on others to drive me around and do things when their schedules were free," he remembers. His long years of grueling physical exercises were paying off. "I believe that the exercises toughened me up, not only physically but mentally as well. I became a stronger man because of it."

Pete talks about his recumbent bike

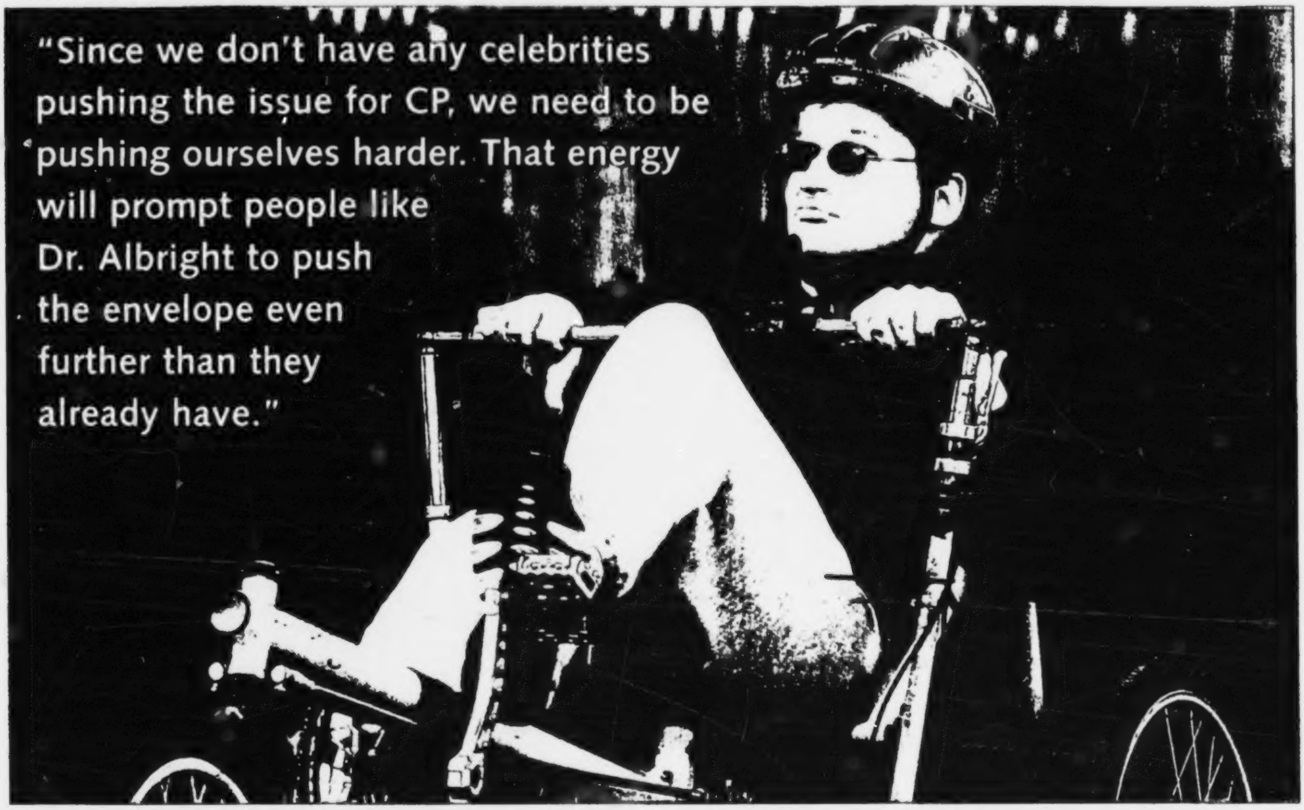
"My first recumbent bike was made by Peach Ridge Pedal Power in Athens, Ohio. The man who made it was a retired engineer who loved to tinker. He built twelve of these recumbents before building mine in a garage behind his house. I needed to have my brother drive me to Athens several times to try out the bike and different adaptations during the course of its construction. For example, the brake handle had to be made larger and run parallel to the handlebars in order to make braking easier for me. Hydraulic brakes were used. The shifters for the gears were longer than is usual and were located close by within my small area of reach. However, shifting was still a great difficulty for me.

"After eight years or so, that bike racked up over 15,000 miles. At that point, it definitely began showing its wear. In the meantime, the salesman of the recumbent had started his own company called Comfort Cycle. He very graciously gave me one of his new bikes, which was two feet shorter that my first eight-foot-long bike. After similar modifications were introduced, the new recumbent was easier for me to get on and off. Since the new bike was also ten pounds lighter, I was able to go faster and travel farther distances. It was also easier to transport. Unfortunately, it was not equipped with a roll bar, which could have made my accident less severe."

During the long hours of blissful pedaling, Pete came up with the idea to ride his new bike throughout Ohio to raise money for CP research. In 1991, Ohio Elks lodges made this dream a reality by helping Pete organize his awesome 1,000-mile statewide bike trip. Family members, who had always been supportive, helped out in planning and completing the trip. His brother Chris rode along with him for several days, and his parents drove a van that accompanied him throughout the ride. The 28-day trip raised $10,000 and lead to the birth of the Pedal with Pete Foundation (PWP) in 1993.

Each May since, Pedal with Pete (PWP) holds its signature Pedal to Make a Difference bike-a-thon event in Kent, Ohio; this year's event is scheduled for May 18. Participants can choose from a 17 or 40-mile bike ride or a two- to four-mile hike. Those who can't participate in the event but still want to support it are

continued on page 30



"Since we don't have any celebrities pushing the issue for CP, we need to be pushing ourselves harder. That energy will prompt people like Dr. Albright to push the envelope even further than they already have."

continued from page 29

encouraged to make donations (with a contribution of $50 or more, donors can be Pete's Pedal Partner, and have their name listed on a poster attached to Pete's bike during the ride.) All proceeds go to support cutting-edge research conducted by Dr. Leland Albright, chief of pediatric neurosurgery at Children's Hospital of Pittsburgh and one of the foremost researchers in cerebral palsy and movement disorders in the world. Some of Dr. Albright's work includes pioneering the use of the intrathecal baclofen pump and deep brain stimulation.

"What I want is a national center for cerebral palsy staffed by people who have a commitment to improving the life of people who have CP, people who are committed to doing research, to studying the different treatments," says Dr. Albright. "I want a center where people can go for state-of-the-art care and evaluation regardless of their problem—whether it is orthopedic, neurological or involves surgery."

Dr. Albright agrees with Pete's assessment that there is very little research being done in CP and lauds Pete's efforts to change that. "He's a remarkable man. He's done more than any single person I know to raise funds for research in cerebral palsy in spite of having severe CP and having had a broken neck and a spinal cord injury. Maybe only someone who has experienced life as an individual with CP really understands how it affects every aspect of every day."

Participation in Pete's bike-a-thons has grown steadily, with more riders and new sponsors joining every year. Over 100 bikers and 30 hikers turned out for last year's event, which generated more than $21,000 for CP research. The annual event has also inspired satellite rides. On August 17, 2002, Pedal with Pete will hold its first bike-a-thon in Columbus. The event is expected to draw more than 300 riders. In Iowa, a 4-H club now sponsors a bike-a-thon in Pedal with Pete's name. The Emmetsberg, Iowa Ride will take place September 2002.

A New Challenge

If Pete's story ended there, it would be a remarkable record of achievement. But life had yet another new challenge in store for him. In 1999, Pete joined 3,000 other riders in the six-day, 50-plus-mile-a-day bike tour known as the Great Ohio Bicycle Adventure. One day, while cycling down a steep hill, Pete swerved to avoid a parked van and landed in a ditch. Eventually tests would show that he had fractured two vertebrae in his neck and sustained a spinal cord injury.

Though he tries to put the accident into perspective, Pete is still angry about his medical treatment after the accident. "I found out that the medical profession doesn't really (care) about cerebral palsy. When I was first admitted to the hospital, they simply sent me home saying there was nothing wrong with me even though I couldn't move a muscle. I was told that I was just in shock over the wreck and that I would be back to normal after 48 hours or so." In fact, he was paralyzed from the neck down.

His recovery was slow and included long months of partial rehabilitation. Yet the most painful blow proved to be the loss of his hard-won independence. Before the accident, he was able to live on his own, with minimal help, in his Kent apartment. Now he requires the almost full-time services of an aide to undertake his once routine daily activities.

Despite the severity of his injury, Pete struggles to maintain his optimism. "My goals are to continue keeping myself strong and fit and keep my sights set on the future, which will be soon I hope, when there will be a cure for spinal cord injuries and an increased awareness of CP." In the meantime, he has found a new role model and source of optimism in actor Christopher Reeve, who sustained a spinal chord injury in 1995. In Pete's estimation, "Reeve has never once taken the low road, made any excuses or given in to discouragement. Instead, Reeve has courageously talked about his injury and daily challenges, and has become the number one advocate for spinal cord research."

Pete hopes to be that kind of advocate for cerebral palsy research. "Since we don't have any celebrities pushing the issue for CP, we need to be pushing ourselves harder. That energy will prompt people like Dr. Albright to push the envelope even further than they already have," he says. Though it is doubtful that Pete will again bike independently (he now rides a tandem recumbent bike with his brother Chris), he holds onto his dream of having the Pedal with Pete Foundation become nationally recognized. "I would like to see Pedal with Pete host bike- and hike-a-thons throughout the country. I would also like to start a Pedal with Pete endowment at the Children's Hospital of Pittsburgh. With an endowment, I believe that Pedal with Pete can achieve greater recognition and reach a new level of participation and sponsorship."

For now, Pete keeps at his daily workouts, which include stretching exercises, sessions using the leg press, lateral pull down and seated rowing machines, as well as cycling on his stationary recumbent bike. Both a physical and occupational therapist assist with these sessions.

Pete says he is also bolstered by his strong faith in God and by the unqualified love and support of his family. "I have a 4-

THE MELMARK SCHOOL

2600 Wayland Road, Berwyn, PA 19312 ◆ 1-888-MELMARK ◆ Fax (610) 353-4956 ◆ www.melmark.org

Our approved private day and boarding school serves children ages 5-21 who have:

- Autism/Pervasive Developmental Disorders/Asperger Syndrome
- Acquired Brain Injuries
- Cerebral Palsy
- Mental Retardation
- Neurological Disorders

Situated on an 80-acre country campus, Melmark's goal is to maximize independence through "best practices" in Applied Behavior Analysis, functional curriculums, vocational training and collaborative services.

We Offer Your Child:

- Low Student/Teacher Ratios
- Applied Behavior Analysis
- Functional Communication Skills
- Adaptive Physical Education, Aquatics, and Therapeutic Horsemanship
- Physical, Speech and Occupational Therapy
- On-Site Physicians and 24-Hour Nursing
- Psychological and Family Support

To arrange a personal visit, request a brochure or video, contact Peter McGuinness, Director of Admissions, at 1-888-MELMARK Ext. 636 or email admissions@melmark.org

year-old niece, Maddie, and a 2 1/2-year-old nephew, Mateo, who bring such joy to my life. They accept their Uncle Pete unconditionally, and I feel so blessed each time I see them. When I am around them, I briefly forget about having CP and a spinal cord injury." With his many trials, Pete has also received another blessing. "I met a wonderful lady, Chris, about a year ago, and she has brought real joy into my life. I used to dread weekends when others had a significant other to spend their time with. Now I find myself looking forward to the moments that I can share with Chris."

Even with the new hardships he faces as a result of his accident, Pete does not regret the joy and years of independence that biking gave him. In fact, there are still many mornings when he looks out the window, and thinks today would be a great day to go biking. "I loved having the wind in my face," he says, somewhat wistfully, then adds with characteristic humor, "although being so low to the ground did have some major disadvantages, too, (like) that nice, fresh aroma that hovered some warm summer days from roadkill."

Few things have given Pete the sense of completeness and equality that biking gave him. "It was satisfying for me to grind slowly up a very long and steep hill and pass by other bikers who had to get off and walk their bikes up. It was as if I had discovered the place where my inner strength lay. Often times, I would easily pass them on the downhill stretch because of the aerodynamics of my recumbent. At those moments, I would simply smile and wonder what they thought as I smoothly sailed on by."

Despite the hard work, smooth sailing comes easier to Pete Zeidner than self-pity. If there's one message he would like to convey to individuals who struggle daily with cerebral palsy, it's this: "I believe you need to give 200 percent to what you are trying to accomplish. You need to make the extra effort to let people know that you do not feel as if society owes you something because you have a disability. I believe that if you give of yourself, you get a lot more in return." EP

PREVENTABLE DISABILITIES!

Dear Parents:

When my son was born with cerebral palsy, my family and I had no idea how our lives would be affected. We did not see how vulnerable our child was and how he would need our care and protection for the rest of his life. We did not understand that we would become his life-line in so many ways, and he in turn would consume our lives.

As an attorney, I have become deeply involved in brain injury and other birth injury cases throughout the country.

We would be interested in looking into your child's birth if you had complications either during pregnancy, during delivery, or after delivery.

Our medical staff includes a board certified obstetrician and a registered obstetrical nurse.

Please call 1-800-888-LAWS and speak with either an attorney or a registered nurse.

Remember, there are time restrictions.

Sincerely,

Sheldon O Zisook

On the Move

By the Siskin Children's Institute

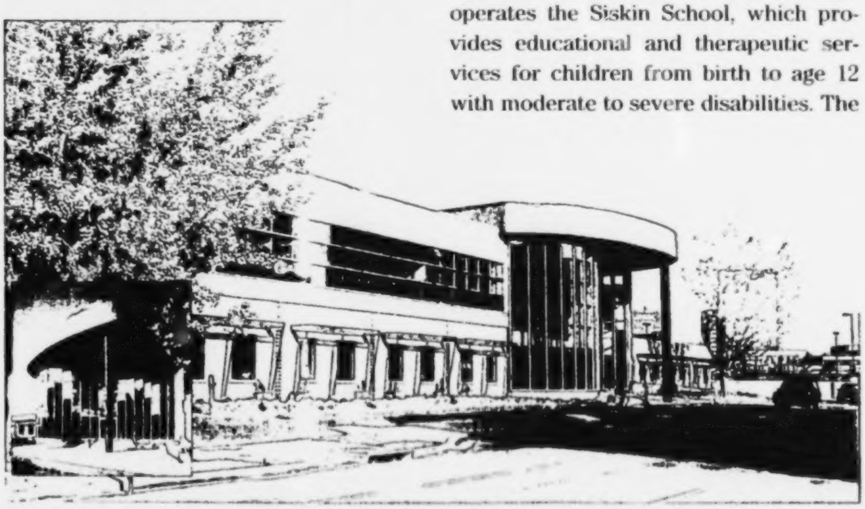
SISKIN
Children's
INSTITUTE

The sound of children's laughter ripples through the new playground at the nonprofit Siskin Children's Institute in Chattanooga, Tennessee. Six-year-old Olivia Helton giggles with delight as she operates a piece of playground equipment from her wheelchair. Grasping a pair of bright yellow handles, Olivia skillfully scoops up sand from the sandbox with a miniature backhoe. A few feet away, several of Olivia's classmates using wheelchairs, tricycles and bicycles glide over the playground's smooth surface. Others play on colorful equipment specifically designed to accommodate children with disabilities, allowing all children to play together.

For children with special needs like Olivia, who has multiple disabilities, the playground at Siskin Children's Institute opens up new worlds of recreational opportunities. Designed by Boundless Playgrounds™ and built by GameTime, the playground provides a fun, safe, universally accessible, developmentally appropriate play area for children of all abilities. "The new playground encourages the physical, emotional, social and intellectual development of our students, and also serves our community as a model of a safe and universally accessible playground," says Paul K. Brock, Jr., president of Siskin Children's Institute.

A model playground is only one of many ways that Siskin Children's Institute is working to meet the needs of children with disabilities and their families in the Chattanooga area. For more than a half century, Siskin Children's Institute has been dedicated to improving the quality of life for these children and their families through excellence in education, support services, advocacy and community partnerships.

"Our broad range of programs and services addresses the challenges of children with special needs—not just educationally, but in all aspects of their development," explains Brock. The Institute operates the Siskin School, which provides educational and therapeutic services for children from birth to age 12 with moderate to severe disabilities. The school offers a full range of services designed to nurture the development of children, including early intervention through family training and classroom programming, school-age classroom programming, the Peer Program, extended care services and comprehensive support services. "The goal of all these services is the same: to help the children reach their full potential," adds Brock.



A New Facility

In August of 2001, the Institute renovated and moved into a spacious 62,000-square-foot building in downtown Chattanooga. The $8.6 million state-of-the-art complex positions the Institute to raise significantly the level of services available for children with special needs and their families and to set a new standard of excellence in the Chattanooga region. In December 2001, a $10 million capital campaign to fund the building and future endowment was successfully completed.

In planning the building, the Institute staff received valuable advice from healthcare and special education professionals. The staff also conducted focus group meetings with Siskin School parents to find out how a new facility could better meet their family's

Supervision is a key factor in safety on playgrounds.

needs. Many features of the new building reflect this input.

Rebuilt from the ground up, the facility includes spacious classrooms, a clinical suite, a children's library and arts center, simulated home environments for family training and a community education center and library. "Our plan was to design a functional and school-like environment in order to provide transitional opportunities for both our families and students. The goal for every child is to transition to natural and less restrictive settings," said Debbie Matthews, Institute director of programs.

A Unique Learning Environment

A colorful land of learning for students lies behind the immense glass walls across the front of the new building. As students and their parents approach the building from the parking lot, the facade of a little red schoolhouse serves as a welcoming point of entry. On the first floor, a large multi-purpose area known as the Commons provides an inviting space for a variety of activities and functions. Offering large views of the outdoors, the area plays host to the children's cafeteria, art projects, indoor play, special events and support group meetings.

Shapes of various size and color guide visitors down the hallways, and brightly painted doors lead into the classrooms. Private observation areas, adjoining each classroom, allow parents to watch activities and identify skills to reinforce at home. Observation areas are also frequently used for training students and professionals in the field of special education and child development. Expanded space in the new building enabled the school to increase the number of classrooms from seven to eleven, increasing capacity from 75 to 115 children.

"In addition to serving children with special needs, the school has an integrated early childhood program for children age 6 weeks to 5 years." At the Siskin School, children with special needs learn alongside children who are typically developing through our Peer Program," says Matthews. "It is the world as it should be —children of all abilities learning together," says Rebecca Caswell, a classroom teacher for children ages 3 to 5.

Learning Activities

Curricular and play-based activities allow children to have fun and learn at the same time. "Each child with special needs has a comprehensive individualized plan, which is a compilation of specific goals and objectives for the year," says Lisa Moore, assistant school director. "Low classroom ratios are maintained and all classrooms are curriculum-based with developmentally appropriate activities. The school not only provides for each child's developmental and educational needs, but also provides a safe and nurturing learning environment for children and families," continues Moore.

Certified teachers and trained assistants facilitate each child's individualized

continud on page 36

continued from page 35

program and encourage parental involvement. "Our staff believes that parent involvement and support are critical to each child's long-term educational success, coping and independence," says Matthews.

Family involvement also encourages parents to exchange ideas and to share information. Parent Patti Frierson frequently discusses medical issues, new medications, and upcoming special education conferences with other parents who have children with special needs. "We benefit from each other's support and experiences," explains Frierson, the mother of a 4-year-old with Down syndrome. "If we have a phenomenal experience with our child, we are able to share that information."

Technology is available to enhance the learning process.

Left: In the therapeutic gym, speech and physical therapists work together to reach goals for each child.

Below: A family participates in the Parent Training Program.

Working Together

A new feature in the complex is a clinical suite with a therapeutic gym. A team of speech/language, physical and occupational therapists, as well as the school psychologist, vision specialist, dietitian and nurses, shares the suite of offices and therapy areas to work together with the children and families in order to meet their individualized needs.

The close proximity of the team promotes frequent collaboration and functional co-treatment sessions in a large, mirrored gym space. For example, during an individual session, the speech/language therapist may work with a child to increase communication and voice production while the occupational therapist addresses positioning and skills that facilitate increased breath support for vocalization. Simultaneously down the hall, the medical director, nurse, dietitian and speech/ language therapist can easily collaborate about a child's oral motor and feeding goals in order to make progress with decreasing tube-feeding dependency while maintaining good nutrition.

Therapy services are also delivered in the child's educational and recreational environments in order to increase functional skills. In the classroom, the physical therapist and teacher may address adaptive equipment so that a nonverbal child can access an augmentative communication device such as a head switch or computer-scanning program. Speech/ language therapists use the playground as a functional therapeutic environment by encouraging turn taking and social language with peers. Physical therapists also utilize the play space to encourage motor skills and increase mobility on a variety of surfaces.

"It takes the entire team working together in order to address the whole child through comprehensive evaluation, programming and direct service provision. Communication with and participation of the family are vital in order for the child to achieve individualized goals and objectives and for skills learned at school to be carried over into the home setting. We know we have done our jobs when a child masters a new skill and generalizes that skill in all environments—home, school and community," says Graham Parker, PhD, school psychologist.

Preparing for Success

Students like 4-year-old Austin Clark, diagnosed with Down syndrome, have greatly improved their communication skills by learning functional sign language at Siskin. Learning sign language has helped facilitate verbal expression and made a tremendous difference for Austin and his family. "The staff has done wonders with Austin," says his mother, Twonna Clark. Austin's father, Tony Clark, agrees: "It's amazing. He is becoming someone who will make positive contributions to society."

Parents with typically developing children in the Peer Program also have access to many resources for evaluating concerns or developmental issues. With low child/teacher ratios, highly trained teachers and access to clinical professionals, Siskin School has become the choice of many Chattanooga families. Heather Ott is the parent of two Siskin students: Parker, a 5-year-old with Down syndrome, and Matthew, a 20-month-old in the Peer Program. Matthew enrolled in Siskin last Fall, while Parker has been a student since he was 2-months-old. "After more than five years of association with Siskin, my husband and I have found that the program does a great job with every child—both typically developing children and those with special needs," says Ott. "Siskin offers an excellent educational program at every level."

Siskin School is the only educational facility in Tennessee that is accredited by the Commission on Accreditation of Rehabilitation Facilities in the areas of Community and Child and Youth Services, which monitors programming for individuals with disabilities by establishing standards of quality. In addition, Siskin School is currently pursuing accreditation by the National Association for the Education of Young Children.

Reaching Out

Community outreach is an important facet of the mission of Siskin Children's Institute. Opening in the spring of 2002, the Institute's Community Education Center will serve as a central resource for families, caregivers, students, educators, medical professionals and other agencies. Emphasizing disability awareness, the Center will provide information and resources regarding special needs, health, safety and recreation. Seminars and workshops will be offered, and parent groups, community organizations and public agencies may request specialized training.

The Community Education Center will have an automated library system with an On-line Public Access Catalog on the Internet. Visitors will be able to stop by

Siskin Children's Institute: The Legacy Continues

Three events—a devastating accident, an urgent prayer and a solemn promise to God—paved the way for the birth of the Siskin Memorial Foundation in Chattanooga, Tennessee, more than a half-century ago.

Badly injured while disembarking from a train in 1942, Chattanooga businessman Garrison Siskin pleaded with God to spare his life. In return, he promised to spend the rest of his days helping those who could not help themselves. God answered Garrison's plea, and Garrison returned home to share the story of his prayer and pledge with his brother, Mose. Overwhelmed by his brother's miraculous story, Mose said, "If it's your promise, it's my promise, and we will keep it together."

To honor their covenant, the Siskin brothers immediately focused their efforts on helping the needy and less fortunate. In 1950, the brothers established the Mose and Garrison Siskin Memorial Foundation as an official step in their vow to help others. Three years later, the Siskin brothers constructed a nondenominational chapel and opened the facility to all races and religions. They soon added an educational building next to the chapel to provide free meeting and office space for charitable, civic, religious, cultural and educational groups in the community.

The brothers also established the Siskin Child Study Center, the first preschool program in Tennessee that provided educational and therapeutic services to children with disabilities, regardless of race, religion or financial status. Today the Siskin School continues the legacy by serving children with moderate to severe disabilities from birth through age 12.

As word spread of the Siskin brothers' generosity, more space was needed to accommodate the increasing number of children and adults with disabilities who sought help and treatment. In late 1959, the Siskin brothers built the $1 million, three-story Siskin Outpatient Rehabilitation Center to serve children and adults, and the brothers spent much of their personal fortunes to finance the project.

Mose and Garrison Siskin dreamed of building a hospital to provide inpatient services for both adults and children. Although they did not live to see their dream fulfilled, their work continued through the Siskin Foundation. In 1990, the Siskin Hospital for Physical Rehabilitation, Tennessee's first freestanding physical rehabilitation hospital, opened its doors to patients. The hospital also provided space for the Siskin School and the Foundation's offices.

Soon after the opening of Siskin Hospital, the Siskin Foundation focused on serving the needs of children with disabilities and their families through the Siskin School. In the late 1990s, the Foundation expanded its efforts to include the safety, health and well being of all children by promoting community and family awareness of child safety.

In August 2001, the Siskin Foundation changed its name to "Siskin Children's Institute" to better reflect its mission of service to children in the community. At the same time, the Institute moved into its new facility in downtown Chattanooga. Today the Siskin Children's Institute continues to uphold the mission of its founders by providing a comprehensive range of programs and services—and by offering a lasting legacy of learning and hope to children with disabilities and their families.

Inclusive classrooms utilize a play-based, language-rich curriculum.

continued from page 37

the Center during normal business hours or explore the collection via the Internet.

Books, pamphlets and reference materials—including information on specific health issues, disabilities, parenting, growth and development, grief and loss, nutrition, safety and recreation—will also be available for checkout from the library. Computer workstations in the Center will provide families and professionals with the opportunity to tap into both local and national resources to supply them with up-to-date information about their disability questions.

Community Initiatives

"To meaningfully increase the level of services available to children with disabilities and their families requires partnerships with other organizations," explained Brock. "Our new building facilitates training with some of our partners." Other collaborations include joining with a local music conservatory, Cadek, to provide Kindermusik in the classrooms.

By providing training for students and

professionals, the Institute can also reach more children and families. University of Tennessee at Chattanooga students in education, nursing, human ecology, physical therapy and occupational therapy receive professional training with the benefits of a hands-on learning lab at the Institute.

Pediatric residents from T. C. Thompson Children's Hospital spend time with Siskin students and staff as part of their behavioral/developmental rotation. Residents meet individually with various staff members to review specific topics, and they are also scheduled to participate in family training sessions, team meetings and classroom programming.

In addition, Siskin hosts training for special education teachers through collaborative in-service training sessions with Hamilton County Schools, the local education agency. Education professionals from surrounding areas also visit Siskin to observe and train on specialized programming issues.

Also, in order to increase recreational opportunities for children with special needs and their families, last summer the Institute, along with four other local agencies, provided a summer camp for children with autism at Chattanooga's Creative Discovery Museum, a children's museum. Plans for expanding this year's summer camp offerings with the museum, the Tennessee Wildlife Center and the downtown YMCA are already well underway. In addition, the Institute is teaming up with the Chattanooga Parks and Recreation Department on the design of the city's next two playgrounds to promote universal accessibility for children of all abilities in the community.

"We are limited in the number of children we can serve within the walls of our new building," says Brock. "By providing training and building these partnerships, we are able to extend our mission to more families in the community and give them choices for their child with special needs. Our goal is to play a vital role in helping Chattanooga become a friendlier place for kids with disabilities and their families." EP

AN EXTRAORDINARY PROMISE — AN ORDINARY LIFE

If you or someone you love has had their life turned upside down by epilepsy, an everyday, ordinary life can be the most extraordinary promise of all.

So if you're dissatisfied with the quality of life and seizure control you've had from anti-seizure medications, or you've found their side effects intolerable, discover the difference that VNS Therapy™ can make.

VNS Therapy has been used by over 15,000 patients like Brady with refractory epilepsy that hasn't responded to multiple medication regimens.

If at least two anti-seizure medications haven't worked, ask your doctor about adding VNS Therapy. It's not brain surgery. It's a medical device the doctor implants in the chest, with leads that run up to the vagus nerve in the neck.

It provides significant seizure control for many patients, with no debilitating side effects, and improvement in alertness, fatigue and mood. Some patients are even helped as dramatically as Brady, although VNS results may vary.

A December to Remember

by Frances Ficocelli

Like most married couples, Jim and I were looking forward to starting a family and so were understandably excited when we found out I was pregnant. A few months into my pregnancy, however, complications developed. At one point, I felt unbearable pain and was rushed to the hospital. The doctors told me I had a hormonal imbalance that affected my gallbladder, pancreas, and liver. I was sent home and ordered to follow a low-fat diet and not to gain more than 22 pounds during pregnancy.

As we went on with our daily lives, I tried to find peace. But in my 36th week of pregnancy, I found myself in the emergency room again, this time with a blockage in my intestines. The emergency room doctors decided to deliver the baby immediately via C-section. Within half an hour, Zachary was born. He was a beautiful boy, weighing in at eight pounds, and handsome with his blue eyes and abundant blonde hair.

After Zachary came home, we just enjoyed our lives as he developed into a beautiful, happy little boy. His doctor became concerned, though, when, at 18 months of age, Zachary wasn't talking that much. We decided not to worry, thinking we'll see how things develop by the time he turns 2. When that time came, however, we were very confused and worried about our son. We started noticing his developmental milestones slowing down. He no longer wanted to be held much, and he had very limited eye contact. Worst of all, he wouldn't respond when we called his name. We watched him slipping away.

> Many other parents also complained to the board of education, mostly that the number of children per teacher was high and that another teacher with experience in autism was needed in the classroom.

We were really scared. We had no medical insurance at the time because Jim had lost his job. Our doctor told us to call the "Birth to Three" program, and that someone from the program would come out to our home. We called, but it took several weeks for someone to come. For the next few months we didn't know what was wrong with Zachary. The only thing the professionals from the program were able to tell us was that Zachary had "sensory integration problems." At 3, Zachary was placed into the public school system and enrolled in early intervention.

After many developmental tests and observations, the school's psychologist/consultant offered her opinion that Zachary had autism. We were told to read up on everything we could get our hands on and educate ourselves, because we had to act as our child's advocates. For a while we relied on the school to do what was best for Zachary because we didn't know much about autism, or how to teach him. Since I was self-employed, I could be at Zachary's school daily, and I became very involved with his education. Jim was very much involved, too. We worked

opposite shifts so that Zachary wouldn't be put into daycare. We joined the Autism Society of America and went to workshops and seminars to understand as much as we could about autism.

Zachary had a wonderful second-grade teacher, who unfortunately left at the end of that year. By the time Zachary finished second grade, he was talking a little and was able to answer questions that pertained to his needs. Mostly, he communicated by gestures and body language.

As Zachary got older, neither his ability to communicate nor his academic skills were progressing. Jim and I felt that our son was not getting all the services to which he was entitled. I started calling the State Department of Education to inquire about policies, laws and our rights. I also started researching different teaching methods, as I tried to figure out for myself what was best for Zachary.

When my son reached third grade, he started exhibiting self-injurious behaviors. I'd pick him up at school, and he would have bite marks on his wrists that he had made himself. I would ask the teacher what caused him to do that, and she would tell me "I don't know." I'd ask what was he doing before it happened, she would say "I don't know." So I started coming into the school to observe him and point out for the teacher things that could help to reduce his stress. Things would change for a while, but then the same problems would resurface. He was still hurting himself. This went on for the remainder of the school year. Many other parents also complained to the board of education, mostly that the number of children per teacher was high and that another teacher who had experience in autism was needed in the classroom.

At the end of the school year, when we met with the planning and placement team (PPT), Jim and I informed the school that we felt the program was not working for Zachary. They disagreed and said that he was making good progress. I told them that I wanted him out of the self-contained classroom and placed in a mainstream setting. I was concerned that the classroom environment might be causing his self-abusive behaviors since the classroom was small, the noise level high, and there were a number of disruptions from the other children with autism. In addition, the aides in the classroom were not properly trained.

Jim and I decided to wait for Zachary's four-month report to see just how much progress he had made. These reports had our 9-year-old son at the developmental level of a 4- to 5-year-old. The people from the program thought that was great. Then they told me, you really couldn't go by the tests; they don't give a true score.

Jim and I decided we had to do something to help our son. I was worried about his years in middle school. I knew he wouldn't have a chance in a regular classroom because he would be so far behind his peers, and I didn't want him to be kept in a self-contained classroom. I wanted him to get an education beyond learning functional and vocational skills.

So we started by informing the school that we wanted a program in place to help Zachary be mainstreamed. The school officials told us that he could not be mainstreamed until he stopped his non-purposeful language. So for his fourth grade IEP (individual educational plan), we put in for his goals and objectives a program to reduce his non-purposeful language. We hoped that ultimately when he reached middle school, he would be mainstreamed for part of the day and in a resource room for the rest. In the resource room he could work on his goals individually, and in the regular classroom he would benefit by being with peers.

When the fall came and Zachary entered fourth grade, we were asked to wait until he settled into his routine before the program was implemented. After a month, his medication was changed for medical reasons, and again they asked us to wait until Zachary got adjusted to his new medication. By January of that school year, they said they "were still taking data." Jim and I played their game for a few more months until we decided to hire our own psychologist.

When I informed the school that I had hired a psychologist, they scheduled an appointment with me to discuss the program they wanted to implement. At the meeting, they explained the procedure: they wanted to give him stickers every time he did not use non-purposeful language–as many as 200 a day. I expressed my concerns, indicating that stickers would not be an appropriate reinforcer; it was like giving him a sticker every 2 minutes! They asked me to let them try it for two weeks and see what happened. I asked what they would do in two weeks if it didn't work. They said, "We haven't thought that far ahead yet."

Four school days later, I picked Zachary up at school, and I almost fainted. My little boy was covered with pinch marks across his entire chest and down both arms. I asked his teacher what had happened. She told me he did this to himself. I marched him into the nurse's office and told her I wanted this

continued from page 46

documented, as we knew he had not gone to school in this condition. We also took pictures and made an appointment to see his doctor.

Jim and I went through hell and back over the next few months. We had to prove Zachary was not getting the education that was right for him. We asked for an emergency PPT meeting, and I made phone calls to find an advocate. Jim and I realized we could no longer handle this ourselves. We called L.D.A. (Learning Disabilities Association). We rejected the school's program and asked for an independent evaluation (outside the school district). Then we had to take ALL the necessary steps to prove that the program was no longer appropriate for Zachary's individual needs. And we did it!

Zachary is now attending a private school that specializes in his individual needs. This year we had the best Christmas ever. We got to see our son have a part in a school play for the very first time. The play was called "Santa's Got Mail." And every one of the children participated, their parts decided by their abilities. Because Zachary's communications skills are weak, his part was to perform dance steps to music, and he was coached to do so. All the children did a wonderful job. I commend the staff at his new school. They treat the children with respect, and the children's accomplishments reflect the staff members' efforts. I thank God every day that he is there.

It's been several months since the two incidents of self-abusive behavior—the biting and pinching that caused Zachary to regress—occurred. Since then, he has not been able to talk in a normal voice. He only feels safe when talking in a whisper. We pray every day that this is only a short setback, that in time he will regain the confidence to communicate the way he used to.

Jim and I firmly believe that God gives us only what He knows we can handle. Even though we may ask "why" or question "What did we do to deserve this?" only God knows His plan for us. We were created to do God's work; He has a special mission for all of us. Some people may never know what the purpose of their life is. I am proud to say that I know what mine is: to love and care for Zachary to the best of my ability, to teach him and help him to be as independent as God wants him to be. God's children have a place in our world, regardless of abilities or disabilities. Zachary continues to teach us that every day.

In the short time Zachary has been at his new school, he has grown in independence and self-confidence and, most important, he is learning to trust again. EP

Frances and James Ficocelli have been married for twelve years. They and their son Zachary live in Connecticut.

AN INTRODUCTION TO:

Early Childhood Sensory Integration

Carolyn O. Cantu, MS, OTR

> *"He avoids playing with other children." said the preschool teacher. "Sometimes I think he may be shy, headstrong or just not feeling well. He also refuses to play at the activity centers."*

The parent/teacher consultation was taking place after hours in the child care center. The play behaviors of 3 year-old Jamie worried the preschool teacher. His parents and a pediatric occupational therapist (OT) listened while Jamie merely watched his twin sister dart in and out from under the center's toy parachute. Jamie's behavior raised concerns: watching other children play, overtly refusing to participate, avoiding tactile play substances such as sand, clay or finger paint, and pulling away from touch or hugs were becoming daily occurrences. He seemed to tolerate physical contact only when he himself initiated it. If taken by surprise by the touch of another child or teacher, he cringed, ran away and cried. Snack and lunch times were becoming stressful for Jamie and the staff. He refused to eat most food sent from home, selecting only crunchy or tart items.

The parents contributed their home observations. They were becoming frustrated with their son's refusal to dress in the morning, his screaming while washing his hair or face, and his pulling at his clothes. At night, he refused to sleep under the covers. Jamie rejected most foods at meals, preferring such crunchy food as French fries, onion rings, and potato chips; occasionally he would try fried chicken. His pediatrician was concerned about his recent weight loss, and his overall health concerned his parents.

Identifying the Problem: Understanding Sensory Integration

What was happening? Jamie's twin sister did not display any of these behaviors. Was Jamie competing for attention? Why did he avoid daily activities his peers seemed to enjoy so much? Did other children show these behaviors? Most important, how could Jamie be helped? Could he, too, explore and learn through his environment while feeling safe and secure?

> *Children with sensory problems often are either at high alert (hyperreactive) or unresponsive (hyporeactive) to their environment*

The answers to these questions lie in the explanation of the possible cause of these behaviors. Such symptoms, independent of any other medical cause, may indicate problems with sensory processing, known to physical therapists (PTs) and OTs as **sensory integrative dysfunction.** Disorders in sensory functioning can greatly influence a young child's ability to interact with peers and experience the world.

Thirty years ago, A. Jean Ayres, PhD, OTR, a neurophysiologist and occupational therapist, identified this neurological integration process. Dr. Ayres attempted to explain the relationship between sensory motor behaviors and neural functioning, and suggested that there exists a strong correlation between neural function and the child's degree of success in academic learning. In her book, *Sensory Integration and the Child*, Dr. Ayres explained that normal sensory integration is the organization of sensory information applied to everyday activity. In a child's case, that everyday activity is play. As early childhood teachers know, learning is directly related to the exploration of the environment through play experiences. Sensations of activity enter the child's brain, are

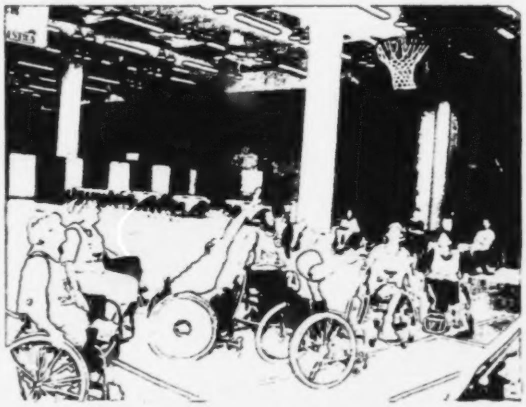
Taking The Next Step Together

Moving forward... a new location... a whole-hearted vision

THE THIRD ANNUAL WORLD CONGRESS & EXPOSITION ON DISABILITIES

SHOW DATES:
Thursday, Friday & Saturday—October 3 - 5, 2002
LOCATION:
Orange County Convention Center—Orlando, Florida

A UNIQUE GATHERING—A Disability Conference and Trade Forum, bringing together families and professionals all under one roof. Orlando, one of the world's most popular vacation destinations, is the perfect setting for this coming together. The WCD will attract **physicians ○ families ○ direct support professionals ○ people with disabilities ○ allied health care professionals ○ educators ○ adapted physical education specialists.**



TRADE SHOW: Meet with over 250 exhibitors including product & service providers, organizations, manufacturers, retailers, home medical equipment dealers, distributors, long term care, rehabilitation and extended care facilities.

SPECIAL FEATURES

SPORTS & RECREATION ACTIVITY CENTER: Features top athletes with disabilities in basketball, tennis, rugby, soccer, track and field and more.

EMPLOYMENT SYMPOSIUM PAVILION: Human resource managers will discuss career opportunities.

FAMILY, PROFESSIONAL AND GOVERNMENT ORGANIZATIONS: Meet with over 30 national and regional organizations, non-profit associations and professional societies.

CONFERENCE PROGRAM: Comprehensive, multi-disciplinary approach to education. Seminars will focus on medicine, education, family issues, advocacy, assistive technology, adapted physical education and career/employment.

- All WCD attendees can experience discussions by internationally renowned experts specializing in neurology, orthopedics, pediatrics, internal medicine, family medicine, physical medicine, epidemiology, DDS, movement disorders, mitochondrial and metabolic disorders, neonatology, seizure disorders, autism, and other disabilities and chronic conditions as well as general practitioners.
- CME and CEU accreditation will be provided through approved accreditation institutions.
- Hear parents and professionals share strategies and techniques for planning and problem-solving in the home, the family, the community and the world at large.
- An Employment Symposium produced in conjunction with the Florida Department of Education, Division of Vocational Rehabilitation Services will offer sessions for people with disabilities, their families and employers.
- Learn from special education professionals what is going on in classroom environments.
- Participate in adapted physical education activities and seminars.

EDUCATIONAL FORUM TO HIGHLIGHT...

THIRD ANNUAL WORLD CONGRESS & EXPOSITION ON DISABILITIES

The third annual World Congress & Exposition on Disabilities (WCD), produced by H.A. Bruno, LLC, will once again present an incredible conference program by offering over 150 educational sessions. The uniqueness of this program is the multidisciplinary focus. Each session is designed to educate many disciplines within the disability community. During the intensive three-day educational experience, information and ideas on today's most important issues will be exchanged between people with disabilities, their families and caregivers and opinion leaders in medicine, science, education, research, technology, and product development. The conference will take place October 3-5 at the Orange County Convention Center in Orlando, Florida.

"Attending the WCD is like going back to college," exclaimed Amanda McIntire, Inclusion Coordinator for Child Care Resource Network, Daytona Beach. "I acquired so much knowledge, interacted with a diverse population, and had a difficult time choosing which 'classes' to take."

The conference program is sponsored by the EP Foundation for Education, Inc., a 501(C) 3 not-for-profit organization, with the assistance of EP Exceptional Parent Magazine and supported by the National Institutes of Health, the Child Neurology Society, WE MOVE and other professional societies and organizations. From pediatrics to geriatrics, some of the seminars will address seizures and seizure management, mitochondrial disorders, spasticity, Project DOCC, learning disabilities, universal newborn screening, movement disorders, perinatal health care, autism and PDD, reimbursement, pain management, the Medical Home, orphan drugs and dental care.

An adapted physical activity program, sponsored by PALAESTRA Magazine, will offer sessions on physical fitness programming; motor skills and gross motor activities; aquatics; APE around the world; various sports such as scuba diving, golf, skiing, goalball, etc.; inclusive indoor and outdoor activities; and much, much more.

"It was refreshing to see parents, doctors, therapists, classroom teachers and adapted physical educators all grouped together with a common interest," said R.R. Apache, Assistant Professor at the University of Nevada.

In addition, the WCD conference program is collaborating on a 50 session employment symposium with the Florida Department of Education, Division of Vocational Rehabilitation Services (VRS) and other statewide provider/advocacy organizations. The purpose of this event is to provide individuals with disabilities, employment counselors, and various employers, with a forum for information exchange. The Employment Symposium will additionally provide participants, individuals with disabilities, Vocational Rehabilitation Services staff, employers, and others with an opportunity to engage in various employment focused discussion sessions.

Continuing Medical Education (CME) accreditation for designated seminars will be offered. Continuing Education Units (CEU) accreditation will be awarded for OT's, PT's, speech and language pathologists, recreational therapists, and social workers through local chapters of national associations. CEU accreditation for educators will be awarded by the Council for Exceptional Children.

In addition to the education forum, WCD will also feature an employment pavilion sponsored by VRS and McDonald's Corp. and a sports & recreation activity center. Attendees will also have an opportunity to examine the latest products and services from more than 250 exhibitors representing pharmaceutical, assistive technology, automotive, mobility, durable medical equipment, personal care, computer, insurance, nutrition, and many other industries.

Early Childhood Sensory Integration

continued from page 47

matched with information already stored there, and are processed to make an effective response. If these sensations are not processed in an organized way, the child will have the kind of outsize reactions Jamie exemplifies.

In everyone's sensory processing system, the brain first receives and organizes information through the senses, then it integrates the new input with information already in the system. If the sensations are disorganized they do not integrate well, as ultimately reflected in behaviors. Information is naturally received through the five senses: sight, hearing, smell, touch and taste. The brain also receives sensory information from additional sources: the **tactile** or touch sense; the sense of joints' position in space, **proprioception;** and the ability to interpret movement in relation to the earth's surface (upright, upside down, lying sideways), the **vestibular** sense. Sensory motor skills are then built upon these basic senses. They include the ability to integrate both sides of the body in bilateral coordinated movement, as in riding a bike or in playing a musical instrument, and motor planning, which is the natural ability to execute movement or sequences of movements without thinking about them. This last skill is based on a strong sense of proprioception. Most self-care activities—dressing, for example, brushing teeth, other grooming—fall into this category.

Children with sensory problems often are either at high alert hyperreactive or unresponsive (hyporeactive) to their environment, because they lack the sensory integration needed to attend to an activity without being distracted by outside stimuli. Think of a child listening to a story who becomes distracted by the airplane flying overhead.

Self-regulation is the last area considered in the scope of sensory integration disorders. Children with self-regulation problems usually demonstrate unusual sleeping patterns, eating difficulties and self-calming issues.

Children with difficulty sensing where their bodies are in space are often described as clumsy or "a bull in a china shop."

Red Flags of Sensory Integration Dysfunction

- Increased sensitivity:
  to sights bright lights, sounds, movements
- Decreased sensitivity:
  craves touch, has high pain tolerance, prefers spicy foods, throws self against people or walls
- Marked increase or decrease in activity level:
  perpetual motion, tires easily, increased sleep
- Coordination problems:
  walking delays, problems with climbing, balance, trips/falls frequently, difficulty with cutting or drawing
- Speech or language delays
- Attention and self regulatory problems:
  distracted from activity by background noise or extra visual stimuli, appears on edge, is difficult to soothe

Evaluation and Intervention

Jamie's behaviors indicate disorganization in the tactile system. His central nervous system is being overloaded with tactile messages because his brain is not organizing that sensory information. He demonstrates a clear hypersensitivity to touch, generally called **tactile defensiveness.** This causes behavioral consequences that are demonstrated two ways: protection from tactile overload by squirming, pulling away, running away, and crying; or shutting down completely by refusing to participate or pushing food away. These are Jamie's defense mechanisms when his brain fails to integrate effectively.

Other children may exhibit different unexplained behaviors. Children with difficulty sensing where their bodies are in space are often described as clumsy or "a bull in a china shop." They may not be able to move smoothly from one part of a room to another. Often a child cries and remains frozen in one spot, unable to plan movements to the next location. These patterns of behavior are what Dr. Ayres described as **sensory integration dysfunction.**

Is it possible for this neural disorganization to be addressed? Is it possible for solutions to be presented at home and in school that will enable integration of sensory information? The answer to both questions is yes. After identifying which of the processes are causing problems, a pediatric OT or PT can select appropriate activities for the child. These activities will either increase tolerance for particular stimuli or decrease the craving for them. Activities are designed, ordered and sequenced to desensitize tactile overreactions, regulate movement (e.g., excessive jumping and spinning), integrate both sides of the body, increase proprioceptive input, and increase the ability to plan sequential movement.

Activities are selected from these categories depending on the needs of the child:

- Auditory;
- Visual;
- Olfactory (smell);
- Gustatory (taste);
- Tactile tolerance;
- Vestibular maturity;
- Body scheme and bilateral integration;
- Attention and self-regulation;
- Proprioception, position in space and motor planning

A child may exhibit symptoms in one or more of these categories. It is up to the OT to identify the areas of delay or dysfunction and to work with parents, teachers and others on the child's team to develop an effective treatment plan.

Therapists may be consulted through an Early Childhood Intervention (ECI) program or through a private practice listing. Although some therapists have extra certification in the theory, evaluation and treatment of sensory integration disorders, there are many licensed therapists who are trained and experienced in this specialty without having the extra certification. In some states, such as Texas, doctor's orders are not necessary for a therapy evaluation and consultation. Physician's orders for the therapist to commence treatment, however, are generally required.

Parents and teachers are usually the first to observe sensory processing difficulties. After discussing their concerns, the first and most important step is a thorough pediatric examination to determine whether a medical or neurological problem might be the cause for the child's behaviors. At this point, either the pediatrician or the teacher

Early Childhood Sensory Integration

continued from page 58

may refer the child to an OT or PT for a sensory integration assessment.

By using parent/teacher interviews, clinical observation, and the administration of formal and standardized tests, the therapist determines the cause and extent of these sensory behaviors. The results are then presented to the parents, physician and teachers and a cooperative treatment plan is drawn up. This plan usually includes an ordered progression of sensory and sensory-motor activities. Consultation with the parents and teachers includes reinforcement for activities in the home and school environments, encouraging a collaborative effort toward treatment and success. Progress reports are to be presented to parents, teachers and physicians on a regular schedule.

After all the observations, interviews and evaluations are complete, the OT may conclude that Jamie exhibits a definite pattern of tactile defensiveness. Therapeutic intervention involves a desensitization program to address this condition. Using a therapeutic "brushing" technique (where a brush is gently run over arms and legs) as demonstrated and monitored by the therapist, Jamie would receive desensitization input enabling him to tolerate touch and tactile substances. Various craft activities might follow, focused on desensitizing his aversion to textures. Activity suggestions for home and the classroom may include tactile experiences such as moving from coloring with markers, to using chalk, to finger painting. The therapist has many varied gross and fine sensory motor activities to use with the child and suggest to parents and teachers. **EP**

Carolyn O. Cantu, MS, OTR, is a licensed pediatric occupational therapist and educator with thirty-two years of experience who has practiced and taught all over the world. Most recently she was a pediatric therapist and clinical educator for the Infant Parent Program, Austin, Texas.

For more information on sensory integration in children log onto www.nmark.com/si/ or www.tsbvi.edu/Outreach/seehear/fall97/sensory.htm.

Suggested sensory motor activities for preschoolers:

Tactile desensitization

- Hidden Treasures—bury small objects, such as mini dinosaur toys, in rice or beans;
- Dry materials bins, sand table—fill with a selection of oatmeal, flour, rice, barley, other grains;
- Shaving cream projects;
- Gardening and indoor plants—digging holes, planting, repotting;
- Pudding paint projects;
- Baking/baking projects—making pizza dough, grating cheese; rolling out and cutting cookies, putting them on cookie sheets.

Proprioception/position in space/motor planning

- Pushing, pulling or lifting against joints, ligaments and tendons, leading to sequential components of a task.
- Hopscotch, jumping, skipping, mini trampoline (feet, knees, bottom);
- Jumping over string tied between two chairs;
- Simon Says;
- Marching (lifting feet high and stamping to musical rhythms);
- Animal walks (bear crawl, elephant walk, bunny hopping, frog hop, crab walk;
- On playground—jungle gym, kickball, volley ball, modified tug of war, riding tricycles.

Vestibular activities

- Rocking horse;
- Balance beams;
- Rocker boards;
- Incline games (climbing up/down on feet, back or stomach);
- Tunnel crawling;
- On playground—jungle gym, moving play ladders, rolling on flat ground or small hills, climbing tires, swings, scooter boards.

Motor planning activities

- Tunnels;
- Mazes;
- Floor maps to be used with toy cars;
- Obstacle course;
- Play cones set in pattern to parade through.

Olfactory/gustatory activities

- Identification with eyes covered of common fruits and vegetables;
- Prepared kits are available for developing discrimination of these senses.

Marked improvement of sensory integration difficulties is often celebrated after a child's participation in a sensory integration program. With occupational or physical therapy sessions reinforced by home and school programs, Jamie and other children with similar sensory integration disorders may begin to experience their world joyfully and without stress.

NATIONAL HUMAN GENOME RESEARCH INSTITUTE AND THE NATIONAL INSTITUTES OF HEALTH OFFICE OF RARE DISEASES Launch New Genetic and Rare Diseases Information Center

Submitted by The Genetic and Rare Diseases Information Center

The National Human Genome Research Institute (NHGRI) and the National Institutes of Health's Office of Rare Diseases (ORD) have launched a new information center that delivers free and immediate access to information specialists who can provide accurate, reliable information about genetic and rare diseases to patients and their families, health care professionals and biomedical researchers.

There are more than 6,000 genetic and rare diseases afflicting more than 25 million Americans, but many of these illnesses affect relatively few individuals. As a result, information about these rare disorders may be limited or difficult to find. The new service, called the Genetic and Rare Diseases Information Center, will help relieve this problem by providing reliable information about individual disorders. Opened in February 2002, the center provides experienced information specialists who can personally answer questions from patients and family members via text (TTY) and traditional phone, as well as by e-mail, fax and mail.

"I am delighted we can provide a resource that should be of great benefit to individuals with genetic and rare diseases and their families," says Francis Collins, MD, PhD, director of NHGRI. "Valid and accessible information about these conditions is hard to find, and having an information center staffed by professionals will provide a critically important service. The National Human Genome Research Institute is delighted to be partnering with the Office of Rare Diseases to establish this center."

ORD Director Stephen C. Groft, PharmD, who currently is on detail as executive director of the White House Commission on Complementary and Alternative Medicine Policy, knew there was a need for a genetic and rare diseases information center when he was executive director of the Commission on Orphan Diseases. "It was a dream of his way back in the 80s," said Henrietta Hyatt-Knorr, ORD's acting director. "The commission heard over and over again from people with rare diseases: 'We need information.' Now people can talk to someone—personally—and get information right away." Hyatt-Knorr continues, "There will be a quick turn around, too. If you just received a diagnosis for yourself, your spouse, or your child, now you won't have to wait to find useful information."

The center operates under a contract with Aspen Systems, an information management company that creates and manages information systems for many health and government agencies. Aspen Systems oversees the technology supporting the NHGRI/ORD information center. The Genetic Alliance, an international coalition of more than 300 lay advocacy organizations and health professionals, staffs the center with information specialists supported by sophisticated technology and the latest information.

"This new Genetic and Rare Diseases Information Center will be staffed by specialists sensitive to the needs of individuals and families with genetic and rare diseases," says Mary Davidson, executive director of The Genetic Alliance. "The experience of reaching a live, compassionate person with accurate information can be lifesaving to many people."

The center provides callers with authoritative information about specific illnesses from existing public-domain sources, including reliable Web sites, brochures, articles and even chapters from books. Experts at the information center ensure that the material sent out is current and accurate. The center, however, does not provide genetic counseling and does not offer diagnostic testing, referrals, medical treatment or advice.

The information center expects most inquiries to come in by phone or e-mail. Calls are answered Monday through Friday, from 12 noon to 6 p.m. Eastern Time by phone and TTY (text telephone). Inquiries submitted via e-mail, fax or US mail will receive a written response from an information specialist within five to ten business days. **EP**

THE CENTER FOR CHILDREN • HOSPITAL FOR JOINT DISEASES

Caring for children with
Cerebral Palsy
requires the help of many specialists.

Now you can find them all at
one special place.

The Center for Children is the one place you'll find all the care options you need, with just one concern in mind: your child. By bringing together the resources of the Hospital for Joint Diseases (HJD) and the Rusk Institute of Rehabilitation Medicine (RIRM) of NYU Hospitals Center, we can care for a variety of conditions in one convenient setting. For example, you'll find the widest possible range of treatments for children with cerebral palsy, with in-house specialties including pediatric physiatry, orthopaedics, speech therapy, neurology, neurosurgery, physical and occupational therapy. All in a gentle, kid-friendly environment where there are no white coats, but plenty of color, interaction, toys, games and stimulation. From newborns to 21-year-olds, The Center for Children treats them better. **Call us at 212-598-2330.**

Universal Newborn Screening

In 1961, Dr. Robert Guthrie of the University of Buffalo developed a laboratory test to detect phenylketonuria (PKU) in newborns. PKU is an inherited metabolic disorder resulting from an enzyme deficiency; if left untreated, it results in profound mental retardation. In 1963 Massachusetts became the first state to mandate screening for PKU, which can be treated by lifelong dietary management and counseling. The National Association for Retarded Children (now The ARC), the Children's Bureau and the Kennedy Foundation were foremost among the organizations that pushed for widespread adoption of the Guthrie test, and by 1966 it was required for all children by all 50 states and the District of Columbia.

Dr. Guthrie and other researchers continued to develop newborn screening (NBS) tests to detect many more disorders, and each state decided what screens would be available for its newborns. Significant disparities resulted; in 1997, in Massachusetts, infants were tested for 10 or more disorders, while Utah's babies were screened for three. Montana and South Dakota each mandated three tests and offered one other by special request only. In the same period, with the introduction of ever-smaller and more powerful microprocessors, technology and equipment became significantly more sophisticated. This permitted testing that had not been feasible before. A process called tandem mass spectrometry (tandem MS, MS/MS) can now run tests for nearly 40 disorders at one time. None are curable, but all are treatable.

In the last two years, many states have expanded their NBS programs. Almost all Pennsylvania hospitals now offer the full spectrum of testing, although the law mandates testing for only six. Massachusetts routinely screens for more than 15 disorders and is running a pilot program offering 30+ tests. Wisconsin has almost tripled availability, from 7 tests to 20. Yet universal NBS still engenders much controversy, and there are many issues to be resolved before consensus can be reached on how the US will move forward.

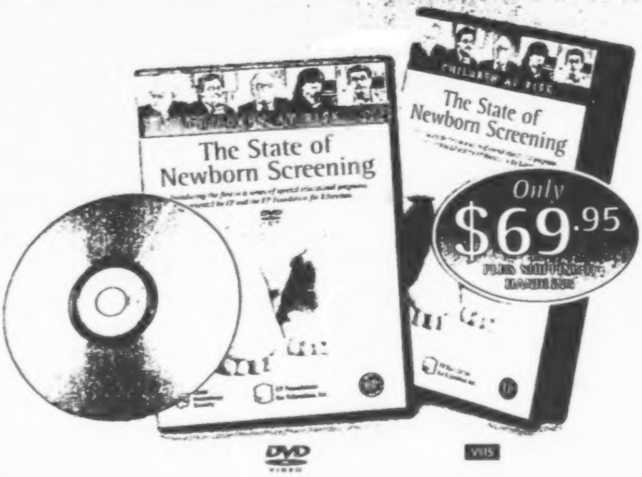
The data tells us that of the four million babies born in the US each year, ten to twelve thousand may have one or more of these detectable...and treatable...disorders

ISSUES: These may be economic, political, professional, sociocultural, religious. Capital spending, training, payment policies, long-term follow-up; insufficient hard financial data; union issues; professional knowledge levels and practice habits; citizen knowledge, and cultural and religious beliefs and practices; insurance, managed care companies, Medicaid, ChIP programs, the uninsured—all these and many more must be part of discussions and resolution.

With the current system, a child born in Louisiana with galactosemia will likely live a life marked by mental retardation and other special health care needs, while similarly affected children born the same day in most of the rest of the country will receive immediate treatment and become productive members of society. The data tell us that of the four million babies born in the US each year, ten to twelve thousand will have one or more of these detectable disorders, an almost-negligible number. The overall cost or benefit to our society, though, will vary wildly from one child to another because of the patchwork of screening availability. We as a nation must find a way to embrace universal NBS and make it routine for all children born in the US. More than that, it is downright wrong not to do so when it has proven its worth time and again!

It is a question of education and awareness. Research shows that the average couple planning to have children does not know anything about existing screening programs, much less the capabilities offered by tandem MS, largely because OB/GYNs, pediatricians, genetic counselors and related professionals are not familiar with universal NBS. The education gap relates to professionals and consumers, rich and poor, people of every race, religion and ethnicity. Few people know much about any of the issues. Worse, among the people who do profess knowledge of NBS and the issues, a good deal of what they "know" is wrong.

The information you need on Newborn Screening is finally available on DVD and video



Children at Risk:
The State of Newborn Screening

is now available on DVD and VHS. Introducing the first in a series of special educational programs presented by EP and the EP Foundation for Education, Inc., a 501(C)3 Not For Profit Corporation.

EP Foundation for Education, Inc. Child Neurology Society EP

Newborn screening can detect up to 39 metabolic disorders from one blood spot. All are treatable when diagnosed at birth, offering the chance for a full and productive life.

Leading medical and scientific professionals are gathered to provide the most current information available. You can view this valuable resource at your convenience and the DVD is indexed so that key topics are easily accessible.

Who am I?

It was Free Play time. As always, the children had many choices: books, theme-related toys, sensory materials and gross motor activities. Naryan came into the classroom and successfully put his belongings away with the assistance of an adult and a picture skill sequence (a pictorial step-by-step guide to the activity). He found a book, sat down and examined each page closely. When he finished the book he went back to the first page and began again. The adult with him suggested that he move on to another activity. When Naryan did not respond, the adult tried to help him put down the book and move on to something else. Naryan grabbed for the book, flung his head back and arched his body. He protested loudly, then ran from the adult. His behavior was difficult and could be considered non-compliant. Why did he behave this way?

PROFILE
A Self-Statement from your child's perspective

Corinne G. Catalano, MA,
Purnima Rathi Hernandez, DDS, MA,
Patty Wolters, COTA

A CHILD WHOSE DEVELOPMENT IS DELAYED may be unable to communicate his feelings to others accurately. When he tries to express his feelings, his attempts may be perceived as odd, inappropriate, even inexplicable. Consequently, both the child and the adults in his life become frustrated.

Each child has a unique personality shaped by temperament, relationships and her rate of maturation in other developmental domains, including expressive and receptive communication, cognition, sensory integration and motor planning, and gross and fine motor skills. With an enhanced understanding of the child's development, we can begin to think about why she is or is not doing something or how she might feel when not engaged. When we imagine experiencing the world as if we were that child, we gather information that can be very helpful in understanding feelings and behaviors.

Writing a "self-statement" or profile from the child's perspective

The goal of this article is to offer broad guidelines for the organization of the thoughts and observations used to create a profile. Included are a sample profile written by a parent, the therapists' reactions to it and a list of uses for a profile compiled from actual experiences.

Suggestions in organizing your thoughts and writing a profile

The profile seems to be most effective and meaningful when written in the first person. For many years, specialists in the field of child development have used this technique in their work. Writing the profile in the first person allows us to experience life from the child's perspective, and helps us to gain a clearer picture of the interrelated development of the child's affective, social, communicative, motor and sensory experiences.

Naryan and his mother Purnima work on sensory integration with Corinne Catalano from the Demonstration Program.

It is imperative that the child be represented as accurately as possible.

Close interactions and observations are key in writing the document. Each and every interaction we have with the child has meaning and is an opportunity to learn something about the child and ourselves. We must become the expert in knowing the child's likes and dislikes in order to represent them well. We need to spend time watching the child from a distance as he goes through daily routines and spend time engaging with him.

continued on page 62

Sample of a profile

This is a sample of a profile presented in the form of a letter written to Naryan's new speech therapists prior to his first visit. The intent of the letter was to introduce the child and help the therapists prepare for the session appropriately.

August 30, 2001

Dear Michelle and Estelle,

Thank you for calling and asking about me. My mother is enclosing my extensive medical history. Also enclosed is a photo of me so you know that I am one handsome dude.

Here are a few additional things about me.

- My balance is poor and I am a very active boy. So most of my energies are expended trying to get my gross motor under control. But when I sit down I can finally concentrate on other things. Sometimes my mother has to force me to sit.
- I love music of any kind. My favorites are nursery rhymes, Barney songs, Mozart and rock especially Queen. Music regulates me and my mother uses it to teach me many skills.

I love to read books and I learn well from books, videos and other visuals. My mother says I am visually impaired, whatever that means, so I need to see things up close and at an angle. I will let you know by my actions when I need to get closer. I am now pointing to each word in the book. In fact I can recognize many words.

- My mother uses numbers, alphabets and colors while teaching me language since I know them well. It usually gets my attention better.
- I usually will take you to what I want and can use at least five picture communication symbols. I don't like signing anymore, but if I find something motivating then I will do anything for it. In fact today I indicated lollipop for the first time. My mother was so happy that she gave it to me in the living room, which usually is not allowed.
- I love using the computer and am very good with mouse skills.
- I have an odd look about me but I understand more than I show. At most times I have a hard time expressing. They say I have apraxia.
- I DO NOT LIKE MY MOUTH TOUCHED. I guard that with all I have. But this summer I have worked hard on allowing more things near and in my mouth so that you both could get near me. I WANT TO TALK. I have so much to say. My first words were Amen and Mama. I can now say others like: caaaa (car), ice cream man, computer, but only my mother can understand them. I say "oh! Mam (man)" is used clearly and purposefully.

I come with many diagnoses pervasive developmental delay, visual impairment, and reflux but I really am a cute, innocent, happy and loving guy. I am looking forward to meeting you both and starting a happy lasting relationship.

Sincerely,
Naryan Hernandez

Response of the therapists to the profile

The profile told us that this parent was very involved in every aspect of the child's life. Also that this parent had a thorough understanding of the child's need. The medical history document and the profile gave a clear picture of the child's medical conditions, behavioral patterns, likes and dislikes and weaknesses. The profile document helped us to prepare appropriate stimulating materials for the first meeting. The parental description also allowed us to determine the physical parameters needed. The profile of this particular child delineated visual deficits, so material could be appropriately positioned from the start of the visit. Since verbal communication was not the child's primary means of communication, alternative augmentative systems could be put in place immediately. Since the parent advised that the child was orally defensive, the therapist did not bombard the child with PROMPT™ (a hands-on type of therapy).

The profile gave an accurate and precise description of the child and we were pleasantly surprised at actually how the first session went.

—Estelle Solomon, MS, CCC/SLP and Michelle Solomon MS, CCC/S

For Family Freedom
Get a Superarm Lift

Handicaps, Inc.

- Quick installation
- Doesn't Block Door
- 3 Year waranty
  5 year limited
- Less Cost
- V.A. tested
- Load in seconds
- Less Parking Space

"We are absolutely delighted with the Superarm Lift. The major advantage is the ease and unobtrusiveness with which it mounts to the van. It is so much more attractive than the various elevator contraptions. The lift has increased our son's mobility by 100%. We enthusiastically recommend the Superarm Lift."

Writing a Profile:
Sample of questions to ask under each developmental domain

Expressive and Receptive Communication:

1. Do I communicate with others and how? (i.e., gestures, words, phrases, augmentative systems)
2. Is it difficult for me to understand things people tell me to do or questions they ask me?
3. What helps me to understand? (i.e., visual cues, fewer words, time to process what they said)
4. How do I feel when I can't communicate my needs and ideas? (i.e., angry, frustrated)
5. What do I do when I can't communicate? (i.e., scream, hit, withdraw)

Cognition:

1. Can I look for something I was playing with after it goes out of sight?
2. Can I represent my feelings and ideas with my words and gestures or through my play?
3. Can I use past experiences to solve my problem? (i.e., drag a chair over to reach something out of reach)

continued from page 60

It is often helpful to note and then analyze our most pleasurable and most difficult times with the child, focusing on three very important variables: the environment, the child and ourselves. For example, many parents find that the child's evening bath provides a very pleasurable time for all of them. The quiet room, warm water and familiar toys may create a calming environment for the child. The feel of the water against his body may help him adjust, and he is happy and more accessible to others. He might be able to carry out the ideas he has for what to do with the bucket and the boats filling the tub. He may also relish the slow-paced, one-on-one time with his parent. The parent can wind down after a busy day, and enjoy the child's bath-time activity.

On the other hand, many parents report that large family gatherings are very difficult for their children. The environment is usually loud, busy and crowded. The parents are probably anxious and may be feeling that all eyes are on their child who is acting difficult and is not interacting with other children. The child is being bombarded by stimuli including voices and faces that are unfamiliar. The other children are moving and talking at a pace that is too fast for him. Unable to handle this environment the child begins to scream and cry or retreats into the safe haven of his own world.

By observing the child in different situations and environments, and working with other therapists and educators, we will learn more about the child's strengths and weaknesses in each of these developmental areas. As we put ourselves in the child's place by writing his self-statement or profile, we will

continued on page 64

Sensory Integration and Motor Planning:

1. How does my body feel most of the time? (i.e., floppy and tired, overexcited and uncomfortable)
2. What helps my body calm down or wake up so I can tune into the world and other people? (i.e., burying myself in pillows or beanbags, jumping, marching, swinging, running)
3. Do I know where my body is in space? If not, what kinds of things do I do to help me understand where my body is? (i.e., lay on the floor so that I can feel each part of my body, sit in a chair with arms so I can feel where I am)
4. Can I organize and feel the stimuli that come at me though my different senses? Do I get overwhelmed because I can't shut out unimportant stimuli? Do I close my eyes or cover my ears so that I only have to pay attention to one type of stimulus? (i.e., auditory or visual)
5. Do I have ideas about what I want to do? (i.e., build with blocks, climb the ladder, play with toy cars) Do I know how to start? Do I know what steps come next?

Relationships:

1. Do I recognize and/or smile when I see certain favorite people?
2. Do I have ideas and memories about fun things I did with certain people? (i.e., When I see Daddy, do I put myself near him and say "up" so we can play the same game we played last night?)
3. Can I calm myself down when I get upset or do I need help from someone else? (i.e., someone talking slowly and softly or rocking me)

Gross and Fine Motor Skills:

1. Can I independently move around my environment to explore things?
2. Do I have the upper body strength to support myself in a seated position?
3. Can I use two hands to explore materials and play with toys?

Surface Behaviors:

1. What do I do when I am left alone? (i.e., run back and forth, watch familiar tapes, play with toys)
2. What do I do with other people? (i.e., move away so they won't interfere with my play, hand them familiar objects)
3. What do I do if someone gives me something new and different? (i.e., throw it, explore it with my mouth and hands, bang it)

Your Family's Freedom is Here:

The Rear Entry Kneelvan.

The whole family fits: Kneelvan seats up to 7 people.

Scooters and chairs that won't fit in other vans can fit in a Kneelvan.

Kneelvan is the most reliable lowered floor minivan ever.

More ground clearance than any other lowered floor minivan.

Kneelvan's rear entry design can park anywhere, even in regular parking spots.

Designed with your family in mind, the **Kneelvan is simply the easiest way to travel**. Unlike side-entry conversions, we designed the rear entry KneelVan so you can **never get blocked by someone parking next to you**. Kneelvan is perfect for families with kids: its the best family van ever.

We would like to invite you to compare Kneelvan for yourself. Call today for more information and our free video.

Naryan working with his therapist Chaye Lamm Warburg. Therapists can help produce a profile.

continued from page 62

gain more insight into how he feels and how we can best provide intervention. The box on page 62-63—Writing a Profile—offers some sample questions parents can ask themselves and others about each area of development.

Uses of a profile

A profile can be used in many ways. In general, the primary uses of a profile are to communicate information regarding a child and promote a deeper understanding of that child by other people in his life. Listed below are some specific ways parents and professionals have used profiles.

- Writing is an excellent tool to find, sort and organize your thoughts. The process of observing the child, analyzing what we see and asking ourselves questions regarding the child's strengths and weaknesses in each domain may help us gain a clearer picture of the interrelated development of the child. It also requires that we think about what it feels like to be this child. This can foster a more empathetic view of the child's behaviors.
- Sharing this profile with professionals in the child's life, such as teachers, therapists, family members and doctors, will help us communicate his behaviors, needs, feelings, likes and dislikes. It may also help the professional identify reasons for a particular behavior and what intervention strategies would be most effective.
- Parents, caregivers and professionals can work together as a team to generate answers to the questions on the template, thereby promoting a transdisciplinary understanding of the child.
- The profile can be used as a tool to communicate the child's

needs to family members who may not be directly involved in the child's day-to-day care. By conveying this information, the profile may influence the interactions of others with the child.

- A self-statement from the child and a photograph can be presented along with medical documents when submitting paperwork to insurance carriers or related agencies.
- When a child with special needs is being included in a regular education setting, parents of the other children in the class, as well as the children themselves, may need information in order to feel comfortable engaging and interacting with this child. Some parents have shared a profile of their child with classmates and their parents in order to foster greater understanding of "difficult" behaviors and facilitate peer interactions.
- The profile can be used during transitions between classrooms or schools. It has been used as a training tool for teachers, teaching assistants and personal aides as well as other team members.

Since the profile will change as the child grows and develops, each revision becomes part of a log of the child's development. The document is a snapshot-in-time that you can always review as needed. It is also a record of facts that might otherwise be forgotten. Therefore it also helps parents and others working closely with the child to step back and take note of the positive changes that are sometimes difficult to appreciate, particularly if they are subtle and have occurred over a long period of time. EP

THE SHERMANS

Amin Sherman, 9, left, wrote to EP about his little sister **Cathy,** 7, who has difficulty walking; his brother **Colton,** 6, bottom right; and **Brenson,**17, who is blind. Amin enjoys watching movies with his brothers and playing Nintendo with Cathy.

DAVID

David Elimech, 11, is in the 5th grade. He receives a great deal of help and support at school, and goes to his special education teacher for math and language arts. His main diagnosis is non-verbal learning disability. He also demonstrates some aspects of autism. He is pictured here riding Caitlin at riding camp at a local farm.

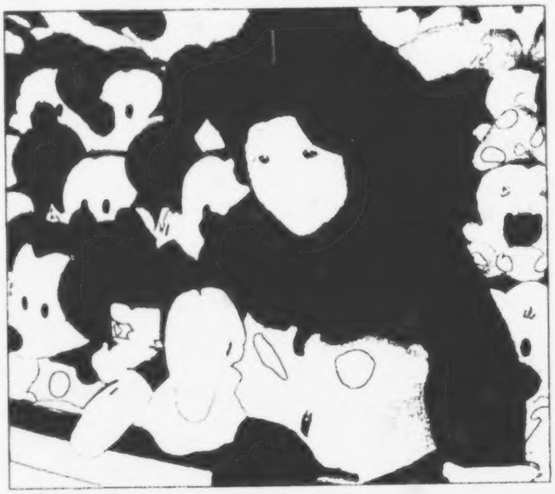
AUSTIN

Austin Douglas Weiss, 2, and his cousin **Brianna** share a hug and some colorfull stickers! Austin has congenital muscular dystrophy. He enjoys watching movies, playing on the computer and going for rides in the trailer behind dad's bike. He loves Barney, Blue's Clues and especially Bob the Builder.

ANDREW

Andrew Burgess, 5, and brother **Nick,** 10, are both accomplished swimmers and love to be under water. Drew receives speech, occupational and physical therapy. He also takes swimming, gymnastics and dance lessons. He even teaches Nick a few wrestling tricks! Nick enjoys racing go-carts, playing with Drew and making him laugh.

JORDAN



Jordan Tyler Pringle,1, loves to dance and learn new things. Jordan was born with Down syndrome and opsoclonus. His mom, MaryBeth, retired early to stay at home and provide special instruction. He is averaging a slight developmental delay with the efforts of a great team for his early intervention program. Jordan thrives from the stimulation and role modeling he gets from his siblings and parents.

Would you like to share a favorite candid snapshot or slide of your child and/or family with other readers of EP? Send it to: Readers' Photos, EP (EXCEPTIONAL PARENT), 65 E. Route 4, River Edge, NJ 07661. (Please do not send originals or "one-of-a-kinds" as we regret that **photos cannot be returned.)** On a separate sheet of paper, write your child's full name, age at the time the photo was taken, address and daytime phone number. Please identify everyone in the photo. If you like, you can also write a few sentences about your child. Then look for a familiar face in an upcoming issue!

Moving Toward Mobility

Building skills and improving health by integrating a range of seating and transport options

by Ginny Paleg, MS, PT

Danny and Sue D write:

Our son Matthew is almost 10. He has learned to sit in a regular classroom chair independently, and he is able to walk across the room in his gait trainer. Yet we still need something to transport him in every day. We had a wheelchair with a headrest and a stroller with a solid linear positioning system. Both were too big and bulky and offered him more support than we felt he needed for short trips to the store. How do you feel about those lightweight, foldable transport chairs?

Ginny responds:

Sounds like you have an equipment showroom in your house! The professionals are in the midst of changing their opinions about how children with gross motor delays should be seated. In the past, we gave children as much support as possible. We emphasized comfort and bio-mechanical alignment.

> **We are learning to separate transport needs, sitting needs and how we view the postural needs of our children.**

It was common to see kids who had some sitting skills using a headrest, chest harness, seatbelt, abductor block, adduction guide, two sets of trunk support, Velcro® inguinal (groin-area) straps, and industrial-strength hook-and-loop foot straps. And of course, most kids were placed in a reclining position to make sure they didn't strain forward. This removed any chance of developing active muscle control. It also gave them a great view of the ceiling.

Lately, younger children—around 3 or 4 years old—are getting power systems. When they are in

continued on page 68

The comments on this and the following pages about wheelchairs have been heard from people around the world. Although compiled with tongue-in-cheek, there are some serious considerations here.

Top 10 Reasons Parents Don't Want Children to be in Wheelchairs

1. My child will not be part of a group, or run and play with siblings and friends.
2. Once my child is in a wheelchair, he is likely to remain in a wheelchair for the rest of his life. Hope is lost.
3. Wheelchairs dent the walls, doorframes and my shins.
4. Wheelchairs take up a lot of room and don't go up and down steps.
5. Pediatric wheelchairs are heavy and awkward for transport in a car.
6. I can't push a wheelchair and a grocery cart or a sibling's stroller at the same time.
7. Pediatric wheelchairs are not the right height for eating at the table with the rest of the family.
8. Pediatric wheelchairs are expensive so I can't afford any other equipment.
9. My child will be immediately labeled when he is in a wheelchair.
10. Children grow rapidly and pediatric wheelchairs need to be replaced every 2-3 years.

continued from page 67

environments where they can't use a power chair, they need something like a stroller or travel chair. The children sit in these for short periods of time, usually less than an hour. The strollers weigh 20 pounds or less, are easy to lift and fold up easily.

Most people sit in a variety of chairs in a variety of ways every day. Problems arise when a person stays in one position for extended periods of time.

Another change is how we see seating systems. We are learning to separate transport needs, sitting needs and how we view the postural needs of our children. When we drive in a car, you and I have a high headrest and use a seat belt. When we get out of the car, we leave these supports behind. Our children should be given this same option. Just because a child requires a headrest and chest support for the bus ride, he shouldn't be required to wear it all day long. Just because it's easier to get a child from the cafeteria to the library in a wheelchair, it doesn't mean she can't sit in a regular classroom chair like her friends when she gets there. Most people sit in a variety of chairs in a variety of ways every day. Problems arise when a person stays in one position for extended periods of time. Bones reshape according to the stress placed on them.

Top 10 Reasons Children Don't Want to be in Wheelchairs

1. I get left there.
2. It's hard to hold hands with my best friend while running on the playground.
3. No one can see the pockets on my designer jeans.
4. People look at me funny.
5. It's hard to get a cuddle.
6. No one will let me play with messy stuff.
7. I can't open the door and go through it.
8. I can't stare anyone down eyeball to eyeball.
9. No one will take my order.
10. My bottom gets tired.

Top 10 Reasons Professionals Don't Want Children to be in Wheelchairs

1. Bones deform.
2. Muscles wither.
3. The circulatory system is compromised.
4. The digestive and excretory systems are compromised when a person is sedentary.
5. Pediatric wheelchairs are too high for teaching pivot transfers. Caregivers have to lift the child's full body weight.
6. When reclined and leaning back against a headrest, the child can't learn or practice head control.
7. Lay people are hesitant to help people get out of a wheelchair; they fear that the child will get hurt. So, instead, the child spends the majority of time sitting.
8. Children are isolated from each other—they can't really get close.
9. If I have more than two students in wheelchairs, we can't go anywhere as a group without making a big production.
10. Young children gather information about themselves every day. If the child spends most of the time in a wheelchair, the child won't "think outside the box."

In this era of managed health care and dwindling health care dollars, we need to spend our money wisely. Perhaps every child does not need a $6,000 wheelchair at age 4. Maybe we should consider a transport chair, priced $400 and up, and put our money into a

ask the therapist

Ten Great Alternatives to Producing "Chair-Shaped" Kids

1. Consider using wheelchairs (or strollers) for transportation only. Provide alternative seating in homes and classrooms. Transfer skills will improve if they are practiced often.
2. Integrate supported standing into the natural sequences of everyday life. For bone health, the child should be weight-bearing at least 45 minutes and up to two hours per day. If the child is past infancy, teach sitting, standing and walking concurrently rather than teaching sitting first, then standing, then walking.
3. Practice range of motion as part of life. Have the child reach for the toothbrush, reach for the water faucet, reach for the book or the piece of fruit.
4. Teach the student to stand for diaper changes or for preparation to sit on the toilet.
5. Change your behavior so the child has the opportunity to learn and practice new skills.
6. Consider using a stroller rather than a wheelchair whenever possible. People are less hesitant to take a child out of a stroller. Supported sitting can be provided in an adapted chair. Usually scoliosis and joint deformities are the result of lack of movement rather than of movement activities.
7. Encourage people to help your child move, not just sit. Teach them how to help your child.
8. Write movement skills into your child's IEP as part of the educational activities, not as a pull-out activity.
9. Make self-initiated movement a part of your child's life, just as it is a part of your life.
10. Find out about a function-based program (like MOVE or Conductive Education).

versatile classroom chair and a stander that the child can move. Now we have spent less money and given our child more options for positioning.

Matthew was very lucky that you have been able to try so many different combinations of equipment.

> **Children do not learn to sit by being immobilized; they learn to sit by learning to coordinate muscle groups to reach and maintain balance.**

Somehow we have fallen into the trap of believing that children with severe motor disabilities should have one basic seating option. If you want your son to improve his sitting skills, you need to teach him to move out of balanced sitting and then find his balance again. Children do not learn to sit by being immobilized; they learn to sit by learning to coordinate muscle groups to reach and maintain balance. Chairs that offer supports should also have the option of easily removing the supports so the child can practice sitting skills for short periods of time many times a day. Of course, these practice sessions should be monitored for safety.

Although wheelchairs are a necessity for many people, they are not the only option in wheeled transportation. EP

In this column, Ginny Paleg, a pediatric physical therapist, answers questions from readers. Ginny works at The Hospital for Sick Children, in Washington, D.C. She specializes in treating children with developmental disabilities and neurological dysfunction.

Since Ginny has not assessed the child in question, parents need to review her suggestions with appropriate professionals. Mention of specific products, medications or treatment techniques illustrates suggestions; she is not endorsing any specific products.

Permobil Power Chairs

Modular Design Ensures Permobil Power Chairs Respond to Every Child's Unique Needs

When a child must use a wheelchair, mobility immediately becomes an issue of utmost concern. Believing that each child has unique needs is the reason that Permobil offers the **Playman/Robo™** and **Chairman KOALA™** pediatric power chairs, and the **MiniFlex™** seating system on its **TRAX™** and Chairman **ENTRA™** chairs. Owned by a private, non-profit Swedish foundation, Permobil has a worldwide reputation and a global impact. From the company's founding, Permobil has always believed that the chair must fit the user, not the other way around.

Permobil began as a challenge for one man

Permobil's beginnings date to 1963 when Swedish physician Per UddÈn heard about one of the first power wheelchairs from a U.S. colleague. At a time when the prevailing attitude was to ignore the existence of the handicapped, UddÈn believed that everyone had the right to live life to the fullest, and he requested one of the new wheelchairs for a patient.

The chair was a disappointment from the beginning. Barely working outdoors, it couldn't even manage interior door thresholds. When the supplier told him it was impossible to design a power wheelchair agile enough for indoor use but strong enough to use outdoors, UddÈn, with hospital machinist Bert Engman, began working in the hospital basement to prove him wrong. The first Permobil power chair, a huge advance in design, set the pace for innovations to come and resulted in pediatric power chairs with almost unlimited options.

The **Playman/Robo's** front-wheel drive allows the child to easily negotiate obstacles outdoors, and it has a nine-inch seat elevator that allows the child to easily reach higher objects. Its programmable **P&G Pilot + ™** controller allows adjustment of acceleration and deceleration to suit the child's driving ability; the **Omni + ™** alternative drive switch is optional. The joystick swings out of the way, making transfers as well as access to tables, desks and counters easier.

A second pediatric chair, the **Chairman KOALA**, is built with the same rugged motors and front-wheel technology as Permobil's adult power chairs but is scaled to fit the needs of a child. Compared to a standard rear-wheel drive chair, the **KOALA** base is only 22 inches instead of 26 inches and its length is 38 inches rather than 41 inches. The **KOALA** is easy to maneuver in tight spaces and is durable enough to withstand the needs of an active, growing child. Its proven front-wheel drive system climbs curbs up to 2-1/2 inches high and has pivoting rear wheels for responsive steering. All four wheels stay on the ground all the time.

The **KOALA** has the MiniFlex seating system, which allows the chair to grow as the child does. There are three different seat and back rest configurations, making it easy to change the seat plates and cushions as the child grows; in addition, the system accommodates other standard and custom-molded cushions. The seat height is fully adjustable and optional power seat adjustments (including power tilt and/or elevator) are available.

The **Playman/Robo** is one of Permobil's most innovative developments for pediatric clients. The **Playman/Robo** is designed so the entire seating system can be lowered to the floor at the touch of a button, which allows the child to play at the same level as friends and makes transfers to and from the chair easier.

The **MiniFlex** seating system is also available on the **TRAX** and **Chairman ENTRA** chairs. The **TRAX** all-terrain chair is Permobil's latest contribution to users interested in the great outdoors, with reliable, powerful, rear-wheel drive and a fully independent suspension for each wheel. The **TRAX** can climb obstacles up to six inches high and travel at speeds up to 5.5 mph for users under age 16. The suspension is adjustable to the user's weight, and the wheelbase can be adjusted to suit the terrain.

The **Chairman ENTRA** is Permobil's most economical power chair system. The **ENTRA** is narrower, shorter and weighs less than other comparable power wheelchairs, resulting in greater turning agility. With front-wheel drive, the **ENTRA** has a smaller turning radius than rear-wheel chairs. Its pivoted rear-wheel assembly ensures that all four wheels are always in contact with the ground.

Permobil offers countless options and four pediatric chairs because we believe keeping up with family and friends is especially important for children. To ensure the chair fits the user, every Permobil pediatric power chair is custom-made for a specific child to meet that child's unique needs. With a Permobil power chair, your child can enjoy a new freedom of movement and more independence.

Columbia Medical

Here's the challenge in a nutshell: your child is too tall or too heavy for their infant car seat. You still want positioning, support and of course safely for your child, even though they have outgrown their regular car seat. Fortunately, there is a product specifically designed to help you with this challenge: the **Columbia car seat.** This seat takes over where infant car seats leave off. Best of all, it not only fits larger and heavier children, but the **Columbia seat** provides an exceptional level of support and positioning. In terms of size and weight, the **Columbia car seat** fits children up to a tall 60 inches in height, and up to a heavy 102 lbs. These seats are fully crash-tested and government certified, meeting not only our U.S.A. standards, but also the tough Canadian and European safety standards. It is the only special-needs seat to meet these three key safety standards. But what good is a car seat to you if it doesn't fit easily in your particular vehicle? Fortunately the **Columbia car seat** has a unique design that makes for easy installation in any sedan, station wagon, hatchback, SUV, mini-van, pickup truck and even school busses. So versatile is the design that the **Columbia seat** even fits in coach-class airplane seats, so your child can fly safely on your family vacations. How does the **Columbia car seat** achieve a high level of positioning and support for each occupant? Firstly, it features a five-point harness. The five belts of this harness come together into a central release buckle, and the shoulder straps and crotch strap are softly padded for comfort and to prevent any chafing. Not only is the length of the straps adjustable, but the locations are adjustable to fit your child as they grow. Supplementing the harness are head pads. These are removable, and adjustable for height and width. Extra sizing pads that conveniently slide under the cover are included, for lateral support. An easily removable padded cover covers the seat. The cover's fabric is plush, soft nylon velour. You have a choice of three colors: blue, silver fox gray or dusty rose.

Naturally the cover is machine washable. There is a wide range of accessories available for the **Columbia car seat.** The range of accessories is constantly growing, and at present includes a seat-depth extender (to create an ideal fit for the largest children); a padded wedge to adjust the seat-to-back angle; a swing-away padded abductor; a buckle-guard (in case the child fiddles with the release buckle); and a height-adjustable tray. Because most children find the car seat so supportive and comfortable, their parents want to use the seat outside the family vehicle. To fill this need, Columbia offers the **Tilt-In-Space Mobility Base.** This accessory turns the car seat into an ultra-supportive stroller-like mobility unit. In the park, shopping at the mall, or anywhere a mobile support is needed, the **Mobility Base** fills the bill. The car seat attaches simply and securely to the **Mobility Base.** The seat may be set at any of three angles of recline on the base, for the most comfort. An adjustable footrest and folding design enhance the usefulness. Large wheels and casters mean easy rolling over uneven terrain. Finally, the modern design and pleasant colors of both the **Columbia car seat** and the **mobility base** make these products good-looking and attractive in any setting. These mobility products are in stock for immediate delivery.

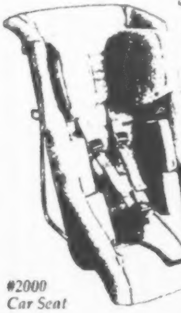
Sharing the Caring

Johnny, 51 lbs. and 48" tall, in the Columbia Car Seat

Columbia offers you solutions to the daily challenges of transporting, bathing and toileting your child – *with comfort, safety and ease!*

You and your child face some tough challenges, but you're the one who must solve them in the most practical ways. Here's how we can help:

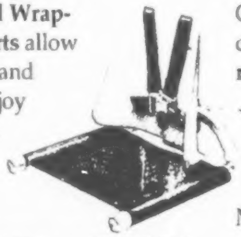
☒ When your child has outgrown that infant car seat, you can have peace of mind knowing that the **Columbia Car Seat** has been crash tested for children from 20 to 102 lbs.-yet weighs only 11 pounds! It has been the No. 1 choice since 1986, for its adjustability and stylish comfort.



#2000 Car Seat

☐ At bathtime, our popular **Reclining Chairs** and **Wrap-Around Bath Supports** allow your child – and you – to enjoy the bath.

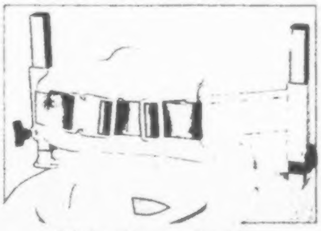
#8600 Medium Recliner for a child 40"-54" tall, up to 130 lbs.



#7700 Hi-Back Wrap-Around Support

☐At toileting time, our **Toilet Supports** fit easily onto any toilet; remove easily, too. And our **Positioning Commodes** give the same toileting support in any location.

Why do these products work so well? Columbia products are thoughtfully designed, with each item available in the **right size for your child**, with lots of adjustability for a custom fit. They are made of durable materials, tested and proven in real-life experience. Made in the USA and sold all over the world, Columbia products are leaders in *all* their categories.



#4200 Small Support for children

Freedom Designs

IN PURSUIT OF EXCELLENCE

We at Freedom Designs, Incorporated, have been involved in manufacturing seating systems and components since 1982. we have an ongoing commitment to quality of product, customer service, delivery time and representation. The vision of excellence extends throughout every phase of order, production and delivery, to ensure you and the end user of the finest product available.

We have a strong commitment to being the leader in the field. We are guided by the needs of the marketplace, by you, the Rehab technology Specialists and therapists. Our unique products are the result of input by industry professionals and our engineering team consisting of a mechanical engineer and an aerospace enginer. With this perspective, and an in-house machine shop, we are able to design the most functional, durable and cost-effective products. With our computerized design capability, we continue to develop better parts, while realizing manufacturing economies, which we can pass along to you.

Our pursuit of excellence also extends to supporting our dealers and therapists. We are involved in an education program, offering CEUs (Continuing Educatoin Units), as well as ongoing training in a field that is rapidly changing.

Our vast line of products, plus our ability to do custom orders, offers state-of-the-art solutions to your difficult seating problems. We thank you, our customers, for your support in the past and look forward to continuiing to serve you.

We make more than parts, we make a difference!

Giiny Maloco—President.
Freedom Designs, Inc.

"Libre Folding Tilt"
with Swing Away Hangers

Introducing the new, versatile Spectrum Libre Folding Tilt frame which has the capability to laterally fold, tilt up to 45 degrees and the option of swing away/removable hangers. Any Freedom Designs, Inc. seating mounting hardware can be adapted to this innovative frame. Highlights include: anodized vibrant colors, 75 or 90 degree swing away hanger options, variety of footrest options attached to the frame and backpost mounted armrest options. This versatile frame comes in widths of 10" to 18" and seating depths of up to 20" deep. Let the new Spectacular Spectrum Libre Tilt give you the freedom you've always wanted in a wheelchair frame.

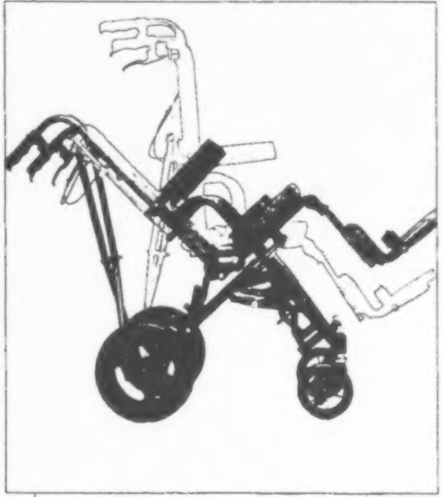
Convaid



For over 25 years, Convaid has been dedicated to helping children with special needs. Our mission is to be sensitive to the broad needs of physically challenged children and, just as important, to the needs of the caregivers. We aim to provide the best combination of corrective positioning, comfort, durability and safety for the child in a product that is both attractive and convenient to use by the caregiver.

Convaid wheelchairs and strollers are best known for their lightweight and compact-folding features. Our chairs are constructed of lightweight materials, and our patented compact folding mechanisms allow our products to be easily carried up steps, placed in the trunk of a car or taken on buses, trains or planes. We took on the challenge of including this important feature on our tilt-in-space positioning chair, the **Safari Tilt.** This resulted in the world's first compact-folding tilt chair. A second folding tilt, the **Rodeo,** has now joined the lineup.

We manufacture five basic chair structures in a variety of sizes and models with dozens of optional features available. This results in a choice of more than one hundred chairs in a variety of colors.

Since 1990, Convaid has been an industry leader in crash testing wheelchairs for tie down in a bus or van. Our chairs are formally tested at a nationally known university, and are proven safe for motor vehicle transport. They tested to exceed the minimum legal safety requirements, as well as meeting voluntary safety standards such as WC-19.

Convaid continually strives to develop innovative new products, and considers it a privilege to serve children with special needs and their caregivers.

Sammons Preston

There is a growing trend in the healthcare products industry that sees American companies bringing innovative designs to the U.S. market by establishing relationships with their European counterparts. As international trade barriers continue to drop, American companies are capitalizing on the fact that most European countries spend proportionately more than the U.S. to provide medical products to their citizens.

A progressive example of this trend is Sammons Preston, the manufacturer of **Tumble Forms** positioning products. The Bolingbrook, Illinois-based healthcare products provider has developed an ongoing relationship with Alvema, a Swedish manufacturer of pediatric seating and positioning products. "Sammons Preston has long been a leader in providing unique seating solutions," notes company group product manager Mike Gravel, "and the Alvema line has added to our depth." Sammons Preston has recently announced the introduction of the **"Mio,"** a new mobile positioning system from Alvema. The Mio is unique in its ability to adapt to multiple bases. It can be purchased with either a stroller base, or a mobile indoor high-low base. The seat itself has a great degree of flexibility, allowing the positioning of clients with mild to complex seating requirements, who are 3 to 13 years old.

It is the high-low base, however, that makes the **Mio** special. This base is designed for indoor use and adapts to all the tasks that indoor living requires. It can be lowered to floor level to allow the child to interact with his peers, or it can be raised up for feeding or work at a computer. The **Mio's** height adjustment takes little effort and is accomplished with the aid of a foot-activated gas spring. And if you are looking for mobility outside of the house, the **Mio** easily comes off the High-low base and snaps into its stroller base.

"Will the seating system grow with my child?" This is one of the questions asked most often by parents of special needs children. The **Mio** appears to tackle this task in a very effective way. The seat back adjusts in height, depth, and angle. It has the unique ability to fold absolutely flat, allowing parents to place their children in a full recline position. The **Mio** has adjustable trunk and hip supports to position the child securely, and a footrest that adjusts in both height and angle. Once optimal positioning is achieved, the entire seat can be tilted in space by squeezing a simple adjustment lever. And if the parent prefers to face their child, the entire seat can be lifted out and reversed in the stroller frame.

Bulky, difficult-to-store equipment is one of the bigger challenges facing parents of special needs children today. This is particularly true when the child must be transported. Often parents are forced to purchase expensive minivans just to be able to get their child from one place to another. Equipment that folds and stores compactly is an invaluable tool for parents and caregivers. One of the reasons Sammons Preston added the **Mio** to its line is the **Mio's** ability to fold compactly. In fact, when installed on the stroller base, the entire **Mio,** including the positioning seat, folds small enough to fit into any standard car trunk. Quality engineering is clearly the driving force behind the **Mio** design.

Strength, durability , and ease of adjustment are goals the **Mio** achieves with little effort. When the engineers at Alvema were designing the Mio, they decided to add one last, very important feature: bus transport. When parents spend a great deal of time and money selecting the right seating system for their child, they expect it to meet as many of their child's functional needs as possible. Transportation to school is a fundamental task that is made infinitely more simple when the child does not need to be taken out of the seating system. With this in mind, the engineers at Alvema designed and crash tested the **Mio** for transportation on a school bus using a standard five point tie-down system. These are only some of the features that are making the Mio a popular American product with a European flair. For more information, call Sammons Preston at 1-800-323-5547.

Otto Bock Health Care Pediatric Postural Mobility Systems

Functional & Fun!

When you think about choosing a postural mobility system for your child, you want a product that has a proven record of reliability – something that gives your child the support they need, that is durable enough to last a long time, and can grow with your child. You also think about features that help you as a caregiver; a system that folds easily, is easy to lift, and a pleasure to look at. The **Lisa stroller** by Otto Bock Health Care combines all these features and more in a functional and fun mobility system.

The **Lisa** was developed for a child requiring mild to moderate positioning assistance. We offer a large menu of optional fitting accessories like headrests, positioning harnesses, and abduction blocks to accommodate a variety of specific positioning needs. The **Lisa** also has a unique backrest recline that can be set at any angle between 90° to 130°, enabling it to suit a number of hip positions.

Keeping in mind that your child is likely to grow, the **Lisa** can grow with your child: the stroller comes in 2 sizes, each with seat depth adjustability and optional backrest extensions and hip width reduction pads. These features enable you to customize **Lisa's** fit to your child and accommodate growth without sacrificing fit.

While providing optimal fit and positioning support, the **Lisa** also boasts great visual appeal. The stroller is available in two, kid-friendly colors and accessories come in coordinated fabric prints and solid colors. The **Lisa** is also caregiver-friendly. Unlike other strollers, **Lisa** has a special scissors & slide design that reduces it to a folded length of 42" or less, so it fits easily into most car trunks. The Lisa is also lightweight and easy to lift.

Most important, the **Lisa** offers maximum stability and strength. The stroller is a powder-coated aluminum frame and its various sections are attached with screws instead of rivets. The seat and back are made of fiber-filled padding with nylon covering. They are reinforced for increased support—no "hammocking" effect in the seat, which can compromise a child's position. We're so confident in this product that we back it with a 5-year warranty.

Joining the other products in Otto Bock Health Care's pediatric mobility product portfolio—the **Kimba tilt & recline system**, the **Bugsy posterior walker**, and the **Spee-Dee gait trainer**—the **Lisa** shares attributes that are the hallmarks of our products: durability, design, and positioning components for each child's specific needs.

Otto Bock Health Care was established in 1919 and has since grown to be the world's leading supplier of prosthetic and orthotic components. Our mission statement commitment is to enhance the agility, mobility, comfort, and confidence of our patient customers. We take this commitment very seriously and believe you'll recognize the results once you see the **Lisa**. Additionally, we offer professional support and education through our Professional Services team, a group of clinically trained individuals committed to ensuring that our dealers and customers are satisfied.

If you are looking for quality, durability, and an experienced company to back up their promises, call us at Otto Bock Health Care. For a dealer near you, call us at 1-800-328-4058.

Quantum Dynamo Power Chairs

Let Children Enjoy Life to the Fullest

Dubbed "the power chair for playing," the **Quantum Dynamo** power chair line is giving children the opportunity to simply be children, sometimes for the first time in their lives.

Manufactured by Quantum Rehab, a division of Pride Mobility Products Corp., the **Quantum Dynamo** power chair line serves the needs of children with varying disabilities, focusing on a child's desire to be an active member of his family and circle of friends.

While the **Quantum Dynamo** offers many features that allow for easy maneuverability in the home, at school or on the playground, parents and children prefer the **Dynamo** for its non-medical, aesthetically pleasing design, outstanding indoor and outdoor performance, and the variety of vibrant, child-friendly colors available.

"The **Quantum Dynamo** line takes away the stigma of being in a power chair," says Scott Higley, National Sales Manager, Quantum Rehab. "The **Dynamo's** design and performance capabilities allow children to keep up with friends in a variety of environments, from the tight corners of the classroom to the playground and ball field."

Positive Outcomes Thanks to the Quantum Dynamo Line

Luke, a young boy with muscular dystrophy, experiences the benefits of using a **Quantum Dynamo** every day. Thanks to the **Dynamo** he affectionately named "Buzz," Luke is able to play soccer and other sports with his brother and friends. Luke's mother, Diane, sees the positive impact this power chair has on her young son's life, returning him to his happy, easygoing personality. "It allows him to be a kid again," she says.

Craig, a six-year old boy from the Washington, D.C. area, was diagnosed with type III osteogenesis imperfecta, a debilitating bone disease. During his first power chair evaluation at the Hospital for Sick Children in Washington, the seating clinic therapists recommended that Craig try out a **Quantum Dynamo** power chair.

The seating team members and Craig's mother were immediately impressed with the results of the trial. The **Dynamo's** versatility, including the compact, maneuverable base with a disassembly feature for transportation. The ability to upgrade to a power tilt seating system and the option for a variety of specialty controls to operate the chair, made it the perfect choice for Craig's size and medical condition.

Features and Benefits of the Quantum Dynamo Power Chair Line

The **Quantum Dynamo** line features the **Dynamo** and the **Dynamo ATS** power chairs. Both models come standard with Pride Mobility's **Versa Seat** seating system, a modular seating framework that adjusts in width and depth as the child grows. The **Versa Seat** accepts specialty cushions for pressure management and offers a manual recline option.

The **Dynamo ATS** comes standard with **Active-Trac Suspension,** further enhancing the chair's outdoor capabilities allowing children to play on rougher outdoor terrain.

The **Dynamo** line accepts a variety of specialty controls, as well as seating systems as small as 10 inches wide by 10 inches deep that can expand as the child grows.

Dual foot platforms are available on the **Dynamo** and the **Dynamo ATS,** providing a means of transfer while offering support for shorter leg lengths.

Both models come standard with 10" knobby drive wheels and Pride Mobility's patented mid-wheel drive technology to give children superior traction outdoors as well as tight-quarter maneuverability indoors.

Available shroud colors include Bronto Blue, T-Rex Red, Gator Green, Primitive Purple, Saber Yellow and Prehistoric Pink.

For more information on the **Quantum Dynamo** power chair line, please call Quantum Rehab toll-free, 1-888-813-4081, ext. 1006.

QUANTUM™ DYNAMO®

The Quantum™ Dynamo® series offers children fun, independence and confidence in their abilities. With Quantum Rehab's patented mid-wheel drive performance, children can play, explore and keep up with their friends.

- Kid-friendly styling and six all-new fun colors that allow children to express their own individuality
- Compact size delivers easy turning, even in kid-sized spaces
- Achieves sizes as small as 10" x 10" with Versa Seat and 12" x 12" with power tilt
- Seat-to-floor heights as low as 15" - perfect for maneuvering under school desks
- Available dual platforms provide easier transfer and extra support for shorter legs
- On-board battery charger for added convenience
- Disassembles for easy transport

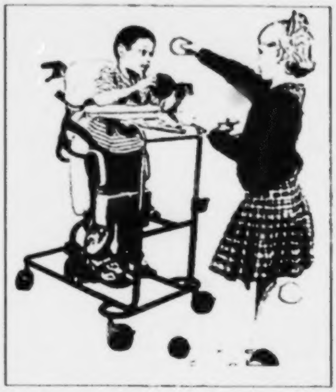
Creating Inclusion by Standing



Making your classroom inclusive does not have to be a difficult task. Many therapists and special educators have found that when their special needs students stand throughout the school day, those students are more responsive, and feel like they are included more in the daily activities. They experience a change in their special needs students who stand that also carries over to the child's home.

*"The **Mobile Magician** is perfect for Tyler's activities. He loves the mobility and he can eat, play, watch TV or, most important, do his homework."*

T. B.—Kansas City, Missouri, USA

School therapists and educators love the **EasyStand** 7000 Magician and EasyStand 5000 Youth standing products. Why you ask? One reason is that our pediatric and youth standing products can also be used as a desk in the sitting position. This alone makes the **EasyStand** a great solution for the classroom, because kids can sit or stand in the **EasyStand,** with full access to the tray. When their peers are sitting at their desks, so can the special needs students. When everyone else is standing, a child who is usually sitting in a wheelchair can also stand up and be part of the crowd.

"Michelle can also use it as a classroom desk. It's very easy for one person to position her and get her up to standing without the risk of injury."

S. K.—St. Cloud, Minnesota, USA

Teachers, professionals and aides love the easy one-person transfers via sliding or the standing pivot method. Kids also feel more at ease because they are being transferred from their wheelchair to another level seated surface. After they are secured, a teacher or aide can gradually lift them into the position they desire, which can be anywhere between sitting or standing.

*"We got the **Magician** because we wanted to avoid the extra lifting needed with other standers. We were also impressed with the many possible positions between sitting and standing."*

H. T.—Boca Raton, Florida, USA

Another reason why the **EasyStand** is so popular in schools is because of the gradual transition from the natural sitting position to the upright standing position. This normal positioning allows for a decreased student fear factor and, the **EasyStand** can stop anywhere between sitting and standing to accommodate for tight hamstrings and contractures. Many therapists like to position their kids in a neutral position, so that the child's weight is equally distributed between the feet and buttocks.

*"With the **Magician** we have the ability to change positions of our students in one piece of equipment."*

D. D.—Albany, New York, USA

"The ability to go from sitting to standing is a plus. Also the ease in putting him into it with just one person is a welcomed benefit."

N. P.—Evansville, Indiana, USA

Since **EasyStand** products have a clear desk table, students can stand as they do school work or fun activities. What does this mean for therapists, parents, and teachers? One advantage is that IEP Goals of standing can be accomplished right in the classroom while the student learns or plays. The **EasyStand** also has the adjustability and support options to fit many students' needs. With only one stander, many of your students can stand safely with the support options they need and a fit just for them.

*"The **EasyStand** is the most versatile and suitable product for our diverse population."*

P.T.—St. John, NB, Canada

*"My daughter feels very safe in the **Magician.** She likes to stand and she is not afraid. This is a big improvement from our previous experience with standing."*

S.M.—Manchester, England UK

The benefits of standing can be physical as well as emotional, and kids of all ages can benefit from standing at school, home, or therapy. Medical professionals around the world have prescribed the EasyStand for their clients so they can enjoy health benefits such as improving range of motion, decreasing contractures, decreasing pressures sores through position changing, improving circulatory and respiratory functions and more.

*"We chose the **EasyStand** Youth post-operation to regain and strengthen leg use and development, and to receive other benefits. Laura loves being upright."* L.V.—Coolbinia, Australia

"With this stander I don't have so much extra lifting like the others. Jack gets more range of motion and weight bearing too!" H. P.—Largo, Florida, USA

Inclusion by standing is achievable when you are using **EasyStand** products. For more information, contact Altimate Medical Inc. at 800-342-8968 or visit www.altimatemedical.com

Standing Small, Growing Tall

Classroom inclusion is now achievable! With the EasyStand, kids can sit when their classmates are sitting and stand when they are standing. The EasyStand line of pediatric & youth standers is perfect for home and school. From early intervention through high school, we can stand all your students.

Baby Jogger

Why the Special Needs 5 Stroller is Really Special!

We've always been known for our **Baby Jogger** strollers, but a little-known fact is that for a long time, we have been making wonderful strollers for disabled children. This is one of the very best parts of our company; because we manufacture in America, our production shop is able to customize to whatever the parents feel is best for their child.

I still remember the first time we built a stroller for an older special needs kid. His mom called me from the ranch they lived on in Colorado. It was a real working ranch, up in the mountains. She explained that once the snow hit, she was stuck in the house with her son, because his expensive wheelchair just couldn't go through the snow. She asked me if we could build something that would let her and her son goes outside in the winter. I asked if their roads were plowed, and they were. So I told her, "If you can walk on the snow-packed road, we can build a stroller that you can push." I will never forget it, because she started crying. And later she sent pictures of her and her son, happily out in the snow.

I was pretty sure of this, because I had my two toddlers, and was pushing them in the first **Twinner** we ever built, on our snowy country roads. My kids loved it. They were all bundled up, and would howl in protest when we turned around to head home.

So we built that first stroller. Then another. Then for quite a while, we were building **Baby Jogger**-like rolling bases, and we would make sure they would accept the seat insert from the wheelchair.

Since we were new to this (in the late 80's), we were very cautious. We started to ask that while we would build whatever they wanted, and we would guarantee that they would be happy with it or there was no obligation, but we did want them to take it into their doctor or therapist for evaluation. So every stroller for **Special Needs** kids that we built, was signed off on by a medical professional. This was invaluable for us, because first we had to meet the needs of the child and the parents, who know what they wanted; but then we were able to get valuable feedback from the medical professionals.

We started to compile info; we visited seating clinics around the country, even places like John Hopkins and the Stanford Medical Center. We started to see patterns in what customers needed, and came out with the **Special Needs 1** stroller. It was just a bigger **Baby Jogger.** Then we learned more and made the **Special Needs 2**, which was more customized for disabled children.

Most of our kids had cerebral palsy. We found that they often slept in a normal bed, and rode in a car with the usual seat. So we were seeing that these kids often reported that they were more comfortable in our cordura sling seat, which hugs the body just like resting in a hammock. So we did less of the rolling bases, more of our own **Special Needs** line.

Today our ability to help **Special Needs** kids is at an all-time high. We have our new Special Needs 5. This stroller folds much easier, making shipping and travel much better. Parents can add on a highback addition to the seat years later, expanding the length of time that the Special Needs 5 will fit their older child. We have an optional footwell, which helps those longer-legged kids, and this can be added at any time. Our best stroller if you also like to run with your kid.

What we really like is that these strollers make the whole family happy. The wonderful kids who use them tell their parents that the really like the bright colors, because it doesn't look medical. This year our colors are Teal, Jade Green, Sapphire, Red, Purple and Navy.

My favorite part is that we have wonderful swivel wheels available now. These actually swap out! So the stroller can have our three big wheels, for going hiking on sand or snow. It can change in a heartbeat to the swivels in the front, so that for home or school, or out at a mall, you can push a very heavy child easily.

Another cool new stroller is our **Custom Seat Adapter** on our **Special Needs 5** frame. If your child needs to be in a molded insert or specialized wheelchair seat, we can work with that manufacturer, and build a **Baby Jogger**-like base that the wheelchair seat can fit into.

One of our most fun adaptations is our **Specialty Two.** I always want to call it the Granny Jogger, because our photos show my mom Judy, in her 70's, in it. We originally designed this for the Disney parks, who requested a stroller that could hold two children, or one disabled adult. It is so much fun to sit in! You can just sit in it for hours and read a book, it is like a hammock on wheels! We had a friend in it who is close to 300 pounds, and pushed him around a trade show for hours. Like the **Special Needs 5,** it has heavy-duty swivel wheels in the front. A great stroller for casual, fun days.

Our **Special Needs** line is approved for Medicaid and we can help parents put it through their insurance company. Usually we can put them in contact with a local physical therapist or medical store if they would like to go in to try the stroller (they tend to be set up for insurance). Or we can help from here, and if your insurance for a "rolling base" is already committed, we can help families with our easy payment plan.

With our Lifetime Warranty, and the fact that the strollers are satisfaction guaranteed, our commitment to our customers is made very clear. We only succeed if everyone is happy with the stroller, and it is comfortable, fun, and safe.

What's next? We are working on an awesome new stroller, that has the ability to carry either a teenager or an adult. Please look for us at the Abilities Expos; we would love to meet you!

Cycletote

The CycleTote Difference

Most bicycle trailers are assembled with plastic or nylon fasteners, use 20 inch wheels and a side-pull chain stay hitch. **CycleTote** alone, with its TIG-welded aluminum frame, full sized (700c or 26 inch) bicycle wheels, a center-pull hitch, and an extremely low center of gravity, has achieved a superb combination of pulling ease, sweet trailing, and ground-hugging stability. It just feels better.

You can actually feel this difference the moment you begin to pull a **CycleTote**. And with average loads the trailer has little or no effect on cycling mobility, allowing you to maneuver your bike normally for a truly enjoyable ride.

The optional automatic braking system is equally superior, providing a safer, more uniform reduction in speed - especially important for emergency stops, with heavier loads, or at higher speeds.

CycleTote performance, together with the strongest protective roll cage and perfectly fitting safety harnesses, earned recognition by Eugene Sloane, best selling author of "The Complete Book of Bicycling" as "far and away the safest child carrier." Tandem Magazine called **CycleTote** "the Lexus of bicycle trailers." "While I don't have any children for it yet, this is the trailer I would entrust with my kids."

Quality and durability are guaranteed by a Lifetime Frame Warranty. And with the option to convert between uses as your needs change (children, cargo, pets, touring, grandchildren, etc.), you're ready for a lifetime of use.

Try one, compare it, and see for yourself. There is no risk. If you don't agree that **CycleTote** is best for you, or if for any reason you just decide not to keep it, call us within 30 days. We'll pick it up and give you a complete, no hassle refund.

This was written at about the time we were introduding the **Special Needs trailers** and is in reference to the rest of **CycleTote**'s family of trailers. Before that some would respond to our boasts of superiority with chuckles and remarks that all trailer companies claim to be best. There is a noticeable change today, especially among those who have had a chance to review our web site. Three factors are key: 1) the foregoing explains why **CycleTote** is better, 2) many testimonials attest to the accuracy of our claims, and 3) we back it up with our satisfaction guarantee.

How well do **CycleTote** trailers meet the elevated expectations of purchasers? We judge this, not only by the glowing comments received from customers, but by the number of trailers actually returned under the guarantee. We're proud to report that returns have hovered around the one percent level for the past several years, and most of these have resulted from an unappreciative canine's failure to share the master's enthusiasm for cycling. Never has a **Special Needs trailer** been returned.

Are the points covered in "The **CycleTote** Difference" also applicable to the **Special Needs trailers**? Knowing that bigger trailers are more cumbersome and that pulling ease and stability are reasonably diminished by increased weight and a higher center of gravity, the advantages of full-sized bicycle wheels and a center-pull hitch remain quite apparent. You'll still feel and appreciate the difference. With more weight to pull, the automatic braking system can assume even greater importance. The design of the **Special Needs trailer** and its roll cage attest to a continued emphasis on safety. And the lifetime warranty and satisfaction guarantee are still fully applicable. So with reasonable adjustments for the increased size, weight and strength of the **Special Needs trailer** the advantages described in "The **CycleTote** Difference" very much apply to the Special Needs trailers.

There is no greater gift than that of freedom and happiness. And there can be no greater gratification than hearing the squeals of delight when a daughter is getting ready for another ride in her **CycleTote** Special Needs trailer. One who has been so rewarded has agreed that we can share some of his happy times with you:

> ***"It has been 3 years since I bought the special needs trailer for my daughter. We have traveled countless miles without incident or problems, not even a flat. It would be difficult to translate all that tire wear into the fun and pleasure we have had with the trailer. It certainly opened up an entirely new world for my daughter that otherwise she would never have experienced. We can take our goodies and treats and make a day of having fun. In all honesty, my daugher smiles, laughs, etc. the entire time she is in the trailer. She never wants to stop and never tires of riding. I can't imagine ever being without the trailer."***

Well Equipped–Designed to Travel

By Trudie Read, OTR/L

The **Lex EASyS**, Ergonomical and Adjustable Safety System for Rehabilitation Strollers, is a revolutionary positioning system that is cleverly disguised as a stroller. The aim of its stylish design is to increase acceptability and promote early intervention, for children from 6 months up to 12 years old. 'An ounce of prevention is worth a pound of cure'.

The unique and patented **Balance Safety System (BSS)** increases the stability of the **Lex EASyS** by maintaining the ideal center of gravity during the tilt-in-space and recline motions. These extraordinary features also reduce shearing forces on the child's thighs and back during recline. In addition, it ensures that the fixed lateral trunk supports and harness remain in the correct position without the need for repositioning the child or making additional adjustments. The **BSS** makes it easy to maneuver difficult situations such as curbsides, steps, and confined spaces, due to its small and stable wheelbase (that eliminates the need for anti-tippers) and two pivoting casters.

All of the adjustments on the **Lex EASyS** have infinite increments within the range and are accessed using large handled knobs on the base, without the need for additional tools. Growth-accommodating adjustments built into the system extend the back height and seat depth and width. The seating system has plush padding for ultimate comfort.

The durable and lightweight aluminum base adapts so that accessories such as head supports fit securely to the frame. The ergonomically designed height and angle adjustable handrail and footplate offer comfort to both the caregiver and the child.

The **Lex EASyS** seating system comes in a Size 1, for children aged 6 months to 5 years, and Size 2, for the 5 to 12-year age range. With the stroller chassis, caregivers can turn the seating system to be forward or rear facing, and utilize the important therapeutic feature of tilt-in-space. The same seating system (Size 1) transferred to the jogger chassis enables the child and caregiver to participate in outward-bound activities.

The **Lex EASyS** stroller comes equipped standard with accessories including a sun/rain cover, storage basket, headrest, hip guides, shoulder harness, and hip belt. Optional accessories, such as a tray, lateral trunk supports, trunk vests, and abduction blocks are also available. The padded, cotton covers are convenient to remove for machine washing. The lightweight chassis and seating systems total just 37 pounds for the Size 1, 42 pounds for the Size 2, and 39 pounds for the Jogger. Designed for travel, **Lex EASyS** quickly fold up and fit in the trunk of a car.

Last, and by no means least, the **Lex EASyS** strollers passed stringent crash testing requirements and come equipped standard with a 3-point transportation tie down system.

490

We like to think of it as a Ferrari in SUV clothing.

Curbs. Steps. Difficult spaces. Now all quickly and stylishly handled with the LEX EASyS Stroller and it's patented Balance Safety System (BSS®).

Lex EASyS sports an aluminum base, ergonomically designed fit, growth adjustments, and plush padding for ultimate comfort. The incredibly mobile LEX negotiates anything from a city street to a country trail.

Test drive one today. One turn and you'll understand how life in the fast lane is now possible for everyone. Vroom!

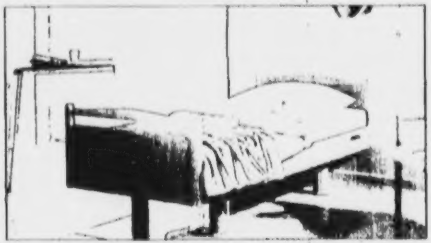
Hertz Supply Co, Inc.

VÖLKER HEALTHCARE BEDS Distributed by Hertz Supply Co Inc

Völker Healthcare Beds address special mobility needs in a unique and positive way. **Völker beds** are different than traditional hospital type beds. They are designed to look like fine furniture, thereby creating a homelike atmosphere in the bedroom. Völker beds are made in high quality wood finishes with special care taken to hide the mechanical devices that can make a bed look clinical. Völker's style of beds has proven very desirable to individuals with disabilities and to families that are providing care for a loved one.

The attractive appearance doesn't mean they are missing any features. Quite to the contrary, they offer more features than most other healthcare beds.

Mobility is provided for in the functions of the **Völker beds.** The head section raises and then also moves a little toward the headboard at the same time. This allows the head section to rise without pushing the feet toward the footboard. This also prevents compression of the individual's mid-section (an important comfort for those who have just had certain types of surgery). The knee section also raises with the additional capability to raise the feet, all activated from the hand control. The bed is height adjustable with the entire bed raising and lowering. This is helpful to assist in entering and exiting the bed as well as providing a welcome assist to the tired back of the caregiver. A reclining chair position can be achieved, allowing for more comfort while eating, working, reading, or watching TV. Side rails are hidden out of sight until they are needed. Disappearing casters on all four wheels allow Völker beds to be moved in any direction. Pushing a button on the hand control electrically operates the casters and brakes.



Décor is always addressed with the **Völker bed.** A variety of head and footboard styles are available in different wood finishes to help match the style of your home. Völker uses beech wood (a hardwood) that is stained to the colors from the current selection. The belletto line from Völker offers a new level of design for those interested in greater style and choice. Beds in the belletto line offer the latest in head and footboard design, and include special mattresses from our beldorma line. *The belletto beds are designed for older youths and adults.* Völker simply offers the greatest choice in healthcare bed design.

Quality is apparent the minute you lay eyes on a Völker bed. The first thing that is noticed is the aluminum lying surface and other aluminum components under the mattress. It is an impressive sight in a world with so much plastic. The aluminum will not rust or corrode if it comes in contact with fluids. Motors are encased in housings that protect them from fluids and provide a product that is easy to clean. The ease of cleaning the entire bed is made possible by the same design that makes the beds look so nice. The old fashion mechanical components that were so hard to take care of have simply been eliminated. They have been replaced by smooth attractive surfaces that are easy to clean. The hand control is water-resistant with buttons that do not wear out easily. Electrical components remove (plug and unplug) easily so many maintenance tasks can be achieved without the need for expensive technical service. Völker offers a new level of quality for the individual who cannot be bothered by technical difficulties.

Safety is built into all Völker beds. You will be immediately impressed by the fact that a Völker bed will not move away from you while trying to get into or out of it. The large legs with non-slip bottoms hold securely to the floor. Casters are activated only when two buttons (on the hand control) are pushed at the same time, thereby eliminating accidental activation. Any time the bed height is raised, the brakes automatically activate. This helps ensure that the bed is secure to the floor. A special motor system for the lying surface does not use any power unless the hand control button is pushed. This means the occupant in the bed is not subjected to electrical fields 24 hours a day. There is also a multi-step electrical protection system in place to prevent any possibility of electrical malfunction. Of course all **Völker beds** are low voltage for your additional protection and are double insulated to safely work on all household wiring (grounded or non-grounded).

Völker is the complete choice in a healthcare bed.

Freedom!

The colorfully designed **DUET** is a wheelchair bicycle tandem that combines the latest in cycle technology with advanced wheelchair design. It's the exhilaration of the wind rushing by your face as friends and family ride together!

Freedom to enjoy the great outdoors like never before! The **DUET** creates recreational opportunities no other product can provide. The **DUET's** "go-anywhere" ruggedness and unique design are appealing to people of all ages and abilities. Everyone wants a ride!

The standard low geared three speed hub enables easy and comfortable pedaling to ensure maximum maneuverability with minimum effort. A seven speed version is also available for more avid bike riders. Both models are available with an electric pedal assist motor. The electric assist works for you when you need it most as you pedal up steep hills and for those extra long rides. Simply turn if off when you desire more exercise!

Safety!

The **DUET** is designed to promote active safety. The easy pneumatic-assisted steering provides light handling while three braking systems ensure complete control at all times. The wheelchair is equipped with drum brakes operated by the bike rider's hand controls. Back pedal brakes are also in place for added braking security. A parking brake provides stability when climbing on and off The **DUET**. The "tricycle" design concept creates a stable ride and when stopping for traffic, there is no need to worry about tipping or trying to balance as the bike sits on all three wheels at the same time.

The wheelchair's low center of gravity provides superior weight distribution and overall stability. This feature also makes it easier for smaller riders to climb aboard! The standard gel seat has an adjustable range of 8 inches and is comfortable for long rides. The **DUET** has been safety tested and has passed US and Canadian government regulations.

Transparent spoke covers and hand shields are available options to keep wandering hands safe from moving spokes and tires.

Quality!

In 1991, The **DUET** was one of three products named "Best New Product of the Year" by North American medical equipment dealers. The award winning ergonomic design of the seat shell provides optimum positioning for the passenger while minimizing surface pressure and reducing the risk of pressure sores. The **DUET** seat supports the back in a natural position and aids in passenger relaxation.

The wheelchair seat upholstery is removable, washable and durable. Velcro strips hold the padding in place.

The headrest can be adjusted up and down, side to side or forward and backward to ensure a comfortable ride for the passenger. The footrest is also adjustable in the same manner, allowing The **DUET** to grow with your child. Swing Away Brackets allow the footrest to swing to either side making it easier for passengers to be seated. For passengers under five feet tall, a Childrens Footboard is available to bring the footrest to their level.

Flexibility!

The **DUET** accommodates "kids" from ages 2 to 95 and all sizes from 20 to 275 pounds! It can be comfortably customized for almost anyone and the quick release coupling system allows you to stop and take part in other activities whenever you want. The wheelchair is easy to use on its own and with the optional push-rims, the wheelchair passenger can move around independently.

The **DUET** can even be ordered without a seat to facilitate customized prescription and special orthopaedic seats, although the majority of **DUET** owners find the standard seat shell comfortable, practical and medically appropriate.

A variety of accessories can be ordered to customize your **DUET** and make the ride more enjoyable for the rider and the passenger from extra safety belts to sun cover and wind protection for the passenger.

Fun!

Riding The **DUET** is beneficial for everyone from mentally or physically challenged to pediatric or geriatric passengers. The sensation of the wind blowing in your face, the thrill of riding in the countryside, down a mountain, or through the city park on such a "neat" machine is therapeutically stimulating to the senses. The cyclist can easily communicate and supervise the wheelchair passenger and get some exercise at the same time!

More and more facilities are adding The **DUET** to their activity program. The **DUET** has been clinically proven to reduce symptoms of depression among nursing home patients when used as part of a specialized biking program. Please contact us for more details regarding this program.

You'll see smiles everywhere you go - everyone wants a ride!

THE DUET
The "Go-Anywhere" Wheelchair/Bicycle Tandem
Enjoy the Great Outdoors like never before!

The DUET is a wheelchair bicycle tandem that allows friends and family to go for a ride in comfort and style. The ergonomic seat is relaxing and allows safe supervision in front. Wheelchair separates for use on its own and for transporting. Hub gear system is easy to pedal. Optional electric motor available.

You'll see smiles everywhere you go - everyone wants a ride!

NO APOLOGIES FOR RITALIN

No Apologies For Ritalin ○ By Vidya Bhushan Gupta, MD ○ EP8012AD- $19.95

Despite its name, No Apologies for Ritalin is aimed at educating parents of children with ADD by presenting all the treatments available for the disorder.

The first half of the book is a look at what ADD is: the medical aspects, how it is diagnosed, and what causes it. Anecdotes of children diagnosed with the disorder and a discussion of how doctors arrive at their diagnoses begin the book. Issues that parents must deal with, such as understanding and coming to grips with the diagnosis of ADD, whether ADD is a product of bad parenting style, ADD's occurrence with other disorders, and who is most at risk are discussed in this section as well.

Section 2 presents the pros and cons of all treatment options, both conventional and alternative, including non-drug therapies such as psychotherapy and behavior modification. The author, Vidya Bhushan Gupta, MD, MPH, FAAP, writes in his Foreword, "I have discussed the controversy surrounding the use of Ritalin and tried to dispel myths surrounding ADD and Ritalin: 'ADD is not a disease; it is simply a difference of temperament,' 'ADD is due to poor parenting;' 'Ritalin is a mind-altering drug like speed;' 'Don't give Ritalin to your children because they will get hooked on it.'" He explains that his purpose for writing the book is so that "parents of children with ADD will not blame themselves for their child's predicament and will be able to use all the available treatments, including Ritalin, without guilt."

The book offers insights into other issues regarding ADD as well, including: who should treat the disorder and what the goals of that treatment should be; suggestions for parents on dealing with their child's ADD; whether children grow out of their ADD; and how to de-emphasize the negative labels of the disorder by recognizing and building on the strengths of children diagnosed with it.

Patient Persistence

Patient Persistence ○ By Adele M. Gill ○ EP8004GN-$19.95

Patient Persistence celebrates the ability of people to overcome obstacles to achieve their goals. Author Adele Gill invited individuals from every background to tell their stories of "hope, courage, hard work, and endurance related to health, disability, relationships, family, ministry, career, accomplishment and challenge."

Ms. Gill is a certified disability analyst/fellow with the American Board of Disability Analysts, and an advocate of inspirational/motivational self-help. She writes, "Patience and persistence are qualities that are vital to the discovery of our finest, God-given gift; the resilient 'Indelible Human Spirit.' These innate qualities propel people and enable them to do great things and overcome significant hurdles."

Patient Persistence is both motivational and inspirational, offering help and hope to anyone who feels that his or her life is out of control, or that things have gotten so bad that there will never be a way to make it better.

BOTH OF THESE BOOKS ARE AVAILABLE THROUGH THE EP LIBRARY BY CALLING 1-800-535-1910, OR BY VISITING THE WEBSITE AT WWW. EPLIBRARY.COM

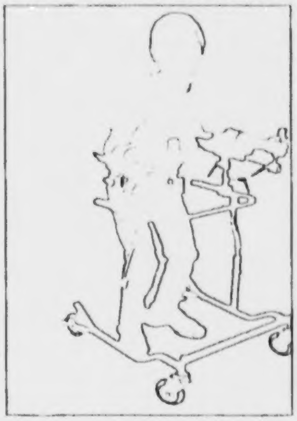
Supporting Your Patients

by Jeffrey Zwiebel, National Sales Manager

Since 1982 Wenzelite Re/hab, located in Brooklyn, New York, has been dedicated to helping patients with special needs. Manufacturers of the original **Adult Safety Roller,** the product line has now grown to include pediatric anterior and posterior safety rollers.

Our pediatric anterior **Safety Rollers** are available in four sizes to accommodate children from early childhood through young adulthood. For the child with a wide gait pattern or one who requires braces to ambulate, we offer a width-expandable model. The **Safety Roller's** adjustments and compatible modular components provide substantial built-in growth. In conjunction with our ingenious automatic braking system and its sturdy and functional design, the **Wenzelite Safety Roller** allows for many years of use.

Many physical therapists prefer posterior (reverse) walkers for children with cerebral palsy and other neurological, orthopedic and developmental disorders. The **Wenzelite posterior Safety Rollers** support users from behind requiring them to procure a more upright posture and to promote trunk extension. Available in three sizes for children ranging from tots to young adults, our **posterior Safety Roller** features one directional wheel that can be disengaged to allow full forward and reverse mobility.



All **Wenzelite Safety Rollers** are height adjustable, fold easily and will stand on their own in the folded position. Naturally, a full line of accessories is available including a superior pelvic stabilizer, adjustable forearm prompts, dial-a-speed tabs for rear wheel resistance and our newest accessory, the posterior positioning bar. This item allows children with shorter arms to be brought forward, enabling them to reach the handgrips. The positioning bar is available only from Wenzelite Re/hab.

Wenzelite Safety Rollers build confidence in children as they encourage safe ambulation and a sense of freedom. The child is never without support and is always in complete control.

In our goal to better serve the physically challenged pediatric patients and to assist their caregivers we have expanded our line even further, to include products that will allow children to achieve the milestones of sitting, standing and mobility. We are dedicated to designing and manufacturing products that will provide maximum support and safety, are aesthetically pleasing to children, parents and caregivers and, most important, are priced correctly for today's market.

Seating is essential to maintain proper body alignment and provide stability and support. Our goal is to combine function with an attractive design. The Wenzelite pediatric seating and positioning systems, the **"MSS Tilt and Recline"** and the **"Cumfi-Sit,"** are designed for children with moderate to severe physical involvement. Their variety of adjustments and positioning options provides maximum support and will accommodate the growing and changing needs of each individual user. Both seating systems are available in two sizes with a choice of a high or low mobility base which converts them from a floor sitter to a high chair. The high base will bring the seating system up to table height. A great accessory to the **MSS Tilt and Recline** is the **"Traveler,"** a lightweight mobility base which will accommodate the seating system. It can retain three tilt positions and all other adjustments. The Traveler features front swivel wheels and oversized rear tires. It folds easily with the seating system in place.

496

Standing is an integral part of most developmentally disabled children's rehabilitation. It helps develop appropriate alignment of the spine, hips, knees and ankles, strengthens muscles and cardiovascular system, improves circulation and range of motion and prevents pressure sores while building endurance. Children unable to bear their own weight can be placed in an upright position and are able to have increased social interaction.

Wenzelite Re/hab manufactures two pediatric standers. The **"Marvel"** freestander is a simple and effective way to provide vertical alignment and upright support. It offers four points of support: at the foot, knee, pelvic and trunk level. The **"Embrace"** meets a variety of positioning needs. It allows prone, supine, and vertical positioning. Positions are easily switched with minimal adjustments for the single user. Both pediatric stander basic models include all accessories.

One of our latest products, the **"First Class"** school chair, was designed for use in the classroom, clinic or home. It is comfortable, attractive and completely adjustable without the need for any tools! It is ideal for physically challenged children with mild to moderate involvement. Its growth capability, height and seat depth adjustability, numerous positioning accessories and available four-wheeled mobility base meet the needs of children as they grow and develop.

Fresh out of the box, our newest product, the **"Dolphin"** pediatric bathing chair, looks like a winner! It is a comfortable and stable adjustable bathing chair that fits all standard tubs. Included with the basic chair is an adjustable headrest, lap belt and a trunk support. The back support has 10 tilt positions including trendelenberg. The seat has 5 tilt positions and can adjust for depth. The **"Dolphin"** folds flat and weighs only 6.5 pounds.

And finally, soon to be announced, the **Wenzelite Gait Trainer** will be making its long awaited debut. Stay tuned!!

R.E.A.L. Design Inc.

R.E.A.L. Design (Rehab and Educational Aids for Living) is a small business located in the foothills of the Adirondacks in upstate New York. The company researches, designs and manufactures products for children with neuromuscular disorders including cerebral palsy and spina bifida. Co-owners Sam Camardello, a mechanical engineer and Kris Wohnsen, an industrial designer, started their company in 1994 in Kris' basement. Before starting R.E.A.L. Design, the two were employed in product development for Tumble Forms. They were part of a team that developed a variety of adaptive equipment including the Tadpole Infant Positioning SystemTM, the Ready RacerTM and the TristanderTM. Over the past years they have been the recipients of design awards from the National Society of Industrial Designers for their children's products and a design grant from the National Endowment for the Arts. Today R.E.A.L. Design has grown to several employees and a much larger facility with the capability of fabricating wood, metal, and plastic components for their products. The staff of dedicated people from college students to "ex-retirees" is committed to making equipment of the highest quality.

REAL Design's focus is on innovation and so as a design driven company they believe in working closely with therapists, parents and other caregivers in all phases of development from concept prototype to final production. "By actively seeking the involvement of clinicians and parents, educators and therapists it helps us understand first hand the needs of children" says Kris Wohnsen. "The decision as to what products we develop is based upon the advice of people whose input we feel is the reason for the success of our product line . " In making products that would assist children R.E.A.L. Design hopes to consider all the child's needs including not only their physical abilities but designs that will enhance their social and emotional growth as well. The company feels strongly that rehab products for children will be enhanced with a creative and aesthetic quality not usually associated with adaptive technology. Seating systems made up of grey leather strapping, metal poles and large black knobs can appear intimidating. It is the philosophy of R.E.A.L. Design to develop products that are not only functional and well constructed but also playful as well. If play is the 'work" of children than products designed for children should address those needs. Bright colors, rounded contours, and playful shapes make a product fun to use and have around. Sisters, brothers or other school children often join in to play during therapy exercises with our products which is precisely the kind of social interaction parents want for their disabled child.

Some of their current product line include:

The LadyBug Corner Chair which is designed for pre-school children. The little red chair with the "ladybug spots" is designed to allow children to sit in either long leg or conventional sitting by simply adjusting the seat back .

The High-Low Chair, a height adjustable chair which (when detached from its pedestal base) becomes a mobil floor sitter.

The Convert-Able Table which adjusts in height from 21 - 37" from the floor so it can be used by children in wheelchairs, standing frames and gait trainers in home school or therapy setting. The table can adapt to become a computer desk, an art easel and even a sensory stim bowl (for holding liquids) by simply interchanging the tops which snap on and off easily.

The Updown Chair, designed for school age children has a foot operated seat height adjustment which can be changed from 12" to 27" from the floor.

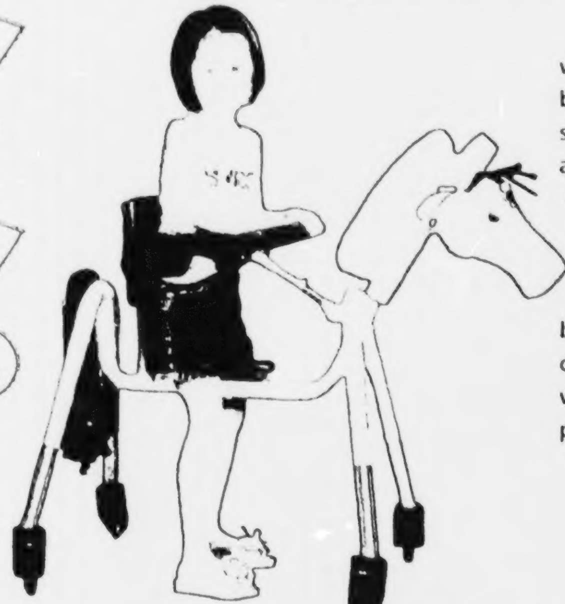
Vivo, the newest product from R.E.A.L. Design is a combination balance rocker and gait trainer. Vivo is designed to address the positioning requirements of the young child ages six months to three years. His bouncy head and colorful beaded mane and tale are part of his appeal for young children. Through working with early intervention therapists it was determined there was a need to design a mobility product for the very young child learning to walk that would take into consideration their need for play .

The future of the company includes continuing to develop innovative products that address the needs of children and the therapists who work with them. As a small company R.E.A.L. Design has the freedom to explore concepts and ideas

R.E.A.L. Design Introduces VIVO™

The New Balance Rocker and Gait Trainer in One!

V
I
V
O



Children will love VIVO, the playful, spirited little pony with the head that bounces when moved and a colorful beaded tail. Parents and therapists will appreciate the valuable skills children gain by playing on VIVO because it functions as a balance rocker or gait trainer by simply interchanging the legs which snap on and off easily. As a rocking horse, VIVO promotes balance reaction skills and upper body postural development. As a gait trainer, it provides incentive for a child to learn ambulation skills. The soft upholstered seat back, with molded laterals, is height adjustable to position children comfortably and securely for rocking or learning to walk. Accessories are available for adapting VIVO to a child's positioning needs.

Southern California Moms "Jump" at the Chance to Help Kids with Disabilities

On Saturday, May 11—Mother's Day weekend—a group of ordinary, relatively sane people will parachute out of an airplane at 13,000 feet in order to raise money—and heart rates—for PAUSE4KIDS, a Ventura County-based nonprofit organization that helps children with physical and developmental disabilities.

The event, "WE CAN FLY," was conceived by Keri Bowers and Terri Mandell, community activists, mothers of children with special needs, and recently converted skydiving enthusiasts. After a mutual friend informed them that she'd done a tandem skydive for her fiftieth birthday, the two Southern California moms decided to take a dive for their cause and invite others to join them. While experienced skydivers will be participating, the majority of participants will be people like Keri and Terri, who are novices at skydiving, but, as parents, teachers, friends and supporters, are experts at caring for children with special needs.

Keri Bowers, whose 13-year-old son, Taylor, has autism, is the founder of PAUSE4KIDS and a cofounder of WE CAN FLY. "It's difficult to explain the link between skydiving and raising a child with special needs," says Keri, "but it definitely has to do with fear and risk-taking. Caring for a child with special needs can be a terrifying experience. Jumping out of an airplane pales in comparison."

Terri Mandell, co-creator of the event, has an 11-year-old son with a life-threatening illness. She also finds skydiving to have a profound emotional benefit. "When you have a seriously ill child, facing fear is all in a day's work. Falling through the sky is a relief compared to the things I experience on an average day."

PAUSE4KIDS works closely with teachers, social agencies, therapists and parents to improve special education programs through organized advocacy. In addition to pushing for legislative reform, PAUSE4KIDS also develops social and recreational opportunities for children with special needs according to its philosophy that special education must encompass education of the whole child.

WE CAN FLY will raise funds by asking donors either to sponsor an individual skydiver or to make a tax-deductible contribution directly to PAUSE4KIDS. The event will take place on Saturday, May 11 at Skydive Perris, the largest skydiving facility in North America. Sponsors, spectators and skydivers (beginners to advanced) are all invited. Admission for spectators is free and special rates are being offered to skydivers.

Skydive Perris, 90 miles southeast of Los Angeles, California, has a large picnic and camping area, a swimming pool, and a restaurant/bar with a view of the drop zone. Visit their Web site, www.skydiveperris.com, or call (800)-SKYDIVE for driving directions and information.

For more information, contact PAUSE4KIDS 50 West Hillcrest Drive, Suite 211 • Thousand Oaks, CA 91360 at (805) 376-2918 or visit the WE CAN FLY web site at http://www.wecanfly.org. EP

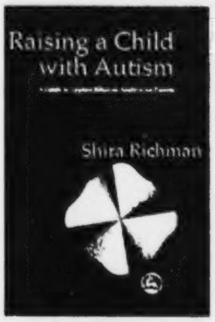
"Raising a Child with Autism"

Reviewed by Marianne Taylor



Raising a Child with Autism: A Guide to Applied Behavior Analysis for Parents

by Shira Richman
Jessica Kingsley Publishers
London, Philadelphia
Available from the EP Library,
(800) 535-1910
code: TF9106AT
price: $19.95
pages: 173, paperback

Is it possible to learn behavior modification from a book? Suspending my skeptical response, I will consider how this book might assist someone in learning what I call the art of "technical parenting." This is the art and skill of parenting a child who may pose extraordinary challenges such as aggression, spitting, lack of cooperation or other difficulties well known to some parents of children with disabilities.

Readers who believe they can learn behavior modification from a book are advised to skip directly to Chapter 4 for a greater likelihood of success. Chapters 1 through 3 are devoted to the "developmental theory" approach to life, the somewhat pedantic and highly technical version of learning theory and behavior analysis.

Generally speaking, "developmental theory" states that A must precede B so that C can occur. This theory makes sense until you apply it to the lives of real people. When you look at its application to children and adults who have disabilities, then it goes something like this: Johnny cannot possibly be included in regular classes until he learns to [fill in the blank: talk, walk, use a communication board or use the bathroom on his own]. In Chapter 1, the author fills this "blank" with "years of therapy" not specifying which kind, as a necessary prerequisite. She states that "Some [children with autism] who begin therapy at a very young age are even integrated into regular school classes." Families and children with disabilities already encounter too many uninformed "dream stealers" who can always find a reason why "inclusion" is not possible — they don't have to hear it from our own "experts"!

In a quiet protest of Chapter 3, I want to tell the story of a boy with autism. He was very popular in his integrated eighth grade classroom because he knew the town's phonebook listings by heart, all because of his amazing memory. He could recite a phone number or a name when given an address and vice versa. The kids thought that this was very cool; and they were right!

These children could appreciate him for who he was and saw his special gift. They were willing to help him with other things that he had difficulty doing because he was a classmate and a friend. That is because, except in the alphabet, A does not always precede B. Often this different sequence exists in our language to make unique and beautiful words, which are quite out of alphabetical order!

This book improves in later chapters as the author brings to bear her broad and deep understanding of how to help children with autism and their families. Chapter 4 provides a wealth of practical information and approaches to solve dilemmas common to these families. For parents, knowing that others share similar experiences and that they are not alone in facing the behavioral problems associated with autism is a gift for the spirit. Learning the proven strategies for resolving these problems is a tool for life; this book offers something for the exceptional parent's toolbox.

The chapter on sibling interaction, while short, is very useful. The author has personal experience both as the sister of someone with a severe cognitive disability who lived at home and as the mother of a child with Asperger's syndrome. It is clear to me that her advice on supporting siblings is on target, sensitive and conveyed with a warmth that does not radiate in earlier chapters.

The final chapter provides some insight into managing the occasional thoughtless or hurtful comments about your child or your parenting made by others in public situations. Sound familiar? The advice here is sound but somewhat limited. I would add to it and advise parents to use the help of friends, therapists and other supportive professionals in building and preserving the sense of well-being and self-assurance from which springs the joy, energy and courage to understand that A does not always precede B. **EP**

Marianne Taylor is the Senior Project Director at the Human Services Institute, an NADSP (National Alliance for Direct Support Professionals) co-chair and mother of a son with special needs.

The National Academy of Sciences has issued a report on educational interventions for young children with autism. The report, "Educating Children with Autism," published by the National Academy Press, is available online at www.nap.edu/catalog/10017.html.

National Alliance for Autism Research

Committed to Accelerating Biomedical Autism Research to Unlock the Mysteries of Autism Spectrum Disorders

The National Alliance for Autism Research (NAAR) is the first national nonprofit organization dedicated to funding and accelerating biomedical research and scientific approaches that seek to determine the causes of, find treatment for and ultimately discover a cure for autism spectrum disorders.

Established in 1994, the National Alliance for Autism Research has committed more than $6 million in grants to fund more than 80 autism research projects worldwide. This year, the National Alliance for Autism Research will invest millions more to fund dozens of additional research projects and mentoring fellowships.

The driving force behind the creation of the National Alliance for Autism Research, Karen and Eric London, started the organization a few years after their son, Zachary, was diagnosed with autism.

As the Londons became immersed in learning all they could about autism and working with their son, they became increasingly aware of the dearth of serious research on autism spectrum disorders. Frustrated, Karen began to think of how they could make a difference.

A corporate attorney by training, Karen began to investigate the nation's leading disease-specific

continued on page 109

NAAR co-founder Karen London and her inspiration, son Zachary.

What is Autism?

Typically diagnosed by the time a child reaches age 2 to 4, autism is a complex brain disorder that often inhibits a person's ability to communicate, respond to surroundings or form relationships with others. The disorder was first identified by Dr. Leo Kanner more than 50 years ago and is considered a spectrum disorder because symptoms and severity vary from individual to individual.

The causes of autism are not known.

Physicians have no blood test or diagnostic scan to rely on in diagnosing autism. Currently, the diagnosis of autism is based solely on the observation of behavior based on a constellation of impairments in communication, social, play and other skills.

There are no specific medical treatments for autism.

The only "treatment" strategies for autism are based on behavior and education and are designed to help a person with autism lead the fullest life possible. Some individuals with autism benefit from pharmacological treatments.

There is no cure for autism.

Although some individuals on the autism spectrum are mildly affected, typically, autism is lifelong.

Common Facts About Autism:

- Autism affects children of all racial, ethnic and socioeconomic backgrounds. The National Institutes of Health estimates that it occurs in as many as one in every 500 children. Some recent estimates of autism's prevalence are even higher.
- There are currently more than 500,000 people in the U.S. with some form of autism, making it the third most common developmental disability, after cerebral palsy and mental retardation.
- Symptoms of autism often don't appear until the child is between the age of 1 or 2 years.
- Autism is four times more prevalent in boys than in girls.
- Despite a national interest in autism and a high prevalence in children, autism research remains one of the lowest funded areas of research by both private and public sources.

Research

The National Alliance for Autism Research has funded some of the most exciting advances in autism research conducted at top universities, medical centers and research institutions. Recent projects funded by the National Alliance for Autism Research include:

Baby Sibling Study

This multi-site study is designed to identify early signs of autism and to determine whether early interventions can improve the quality of life for children with autism and their families.

Researchers in the U.S. and Canada are evaluating a large number of children at an increased risk for developing the disorder—the infant siblings of children diagnosed with autism. While there is currently a trend toward earlier diagnosis, most children are not diagnosed with autism until they are 2 to 4 years old. Babies involved in this study will typically be between 3 and 6-months-old—which will enable scientists to study children far younger than ever before and follow them prospectively for the first signs of delayed or abnormal development.

Autism Tissue Program

In 1998, the National Alliance for Autism Research played an instrumental role in establishing the Autism Tissue Program, the first parent-led brain tissue donation program for autism research. The program currently has enrolled more than 2,600 tissue donors.

The Autism Tissue Program makes post-mortem brain tissue available to as many qualified scientists as possible to advance autism research. Using brain tissue, scientists can go far beyond the limits of other technologies to study autism on a cellular and molecular level. Brain tissue studies also increase the ability to diagnose autism earlier and to assess better the risks of inheritance.

The program is a collaborative effort with the Autism Society of America Foundation and the Medical Investigation of Neurodevelopmental Disorders (M.I.N.D.) Institute at the University of California Davis. For information about tissue donation, call (877) 333-0999.

Genetics

Genetics has been an area of research funded by the National Alliance for Autism Research since NAAR first began awarding grants and remains an area of intense focus because of autism's apparent hereditability. Comprehensive studies of identical twins and siblings have determined that some individuals are genetically susceptible to autism. The twin studies determined that in two-thirds of identical twins where one twin develops autism, the other twin will also develop autism. Additional studies have determined that siblings of children diagnosed with the disorder are between five and 10 percent more likely to develop the disorder.

Recent genetics projects funded by the National Alliance for Autism Research include the annual Calloway Gardens Genetics Collaborative, an annual retreat co-sponsored by NAAR and the Nancy Lurie Marks Family Foundation that provides a unique venue for the world's top research teams to teams to share findings and combine data with the hope of accelerating the identification of autism susceptibility genes; and the development of the Web site, http://www.exploringautism.org, an online educational tool for parents that explains the genetics of autism and provides current news about genetics research and autism. This Web site—funded by NAAR—was created by the Center for Human Genetics at Duke University Medical Center and Tufts University/New England Medical Center.

MMR & Autism

Perhaps no topic related to autism is as controversial as the debate surrounding the MMR (measles, mumps, rubella) vaccine. Some parents and family members of children with autism believe the MMR vaccine caused their child's autism. Parents report that their children were developing normally until they received the MMR vaccine, after which the children started showing signs of autism.

At the request of the Centers for Disease Control and Prevention and the National Institutes of Health, the Institute of Medicine at the National Academy of Sciences conducted a review in 2000 of all the evidence related to the MMR vaccine and autism. The same year, the American Academy of Pediatrics independently reviewed the topic of the MMR vaccine and autism. Both studies concluded that the research to date does not support a link between autism and the MMR vaccine. Nonetheless, both reports called for more research into the relationship between MMR and autism.

In 2001, the National Alliance for Autism Research and the Centers for Disease Control and Prevention provided the funding for an autism component to a large-scale research project in Denmark called the Danish National Birth Cohort, which will involve 100,000 pregnant women and then their newborns. The autism component of this study will specifically evaluate the effects of the MMR vaccine and autism.

WALK·F.A.R.

WALK F.A.R. FOR NAAR

Established in 2000, Walk F.A.R. for NAAR has become the National Alliance for Autism Research's signature fundraising and autism awareness event held annually in numerous communities across the United States. Since the first Walk—founded by NAAR volunteers Renee Georgi and Joan Stahl in Pittsburgh—more than 20,000 walkers have participated in the event, which has raised more than $5 million for autism research.

The success of the Walk is a testament to the network of families, volunteers and supporters that the National Alliance for Autism Research is fortunate to have in cities and towns throughout the country.

2002 WALK F.A.R. for NAAR Schedule

Pittsburgh
Saturday, May 18
Pie Traynor Field at
North Park, Pittsburgh, PA
(412) 487-6851

Westchester/Fairfield
Sunday, June 2
Manhattanville College,
Purchase, NY
(203) 964-9880

Southern New Jersey
Saturday, June 8
Cooper River Park,
Pennsauken, NJ
(888) 777-NAAR

Seattle
Sunday, June 9
Marymoor Park,
Redmond, WA
(206) 275-4490

Iowa
Saturday, June 15
Gray's Lake, Des Moines, IA
(515) 246-7940

Long Island
Saturday, Sept. 28,
Eisenhower Park,
East Meadow, NY
(516) 327-4646

Buffalo
Sunday, Sept. 29
Delaware Park, Buffalo, NY
(716) 522-9185

New England
Sunday, Sept. 29
MDC Artesani Park,
Brighton, MA
(978) 887-6966

Central New Jersey
Sunday, Oct. 6
Mercer County Park,
West Windsor, NJ
(888) 777-NAAR

Northern New Jersey
Fall 2002 - Date not yet determined
Giants Stadium, East Rutherford, NJ
For more information, call (888) 777-NAAR

Miami/Dade County
Saturday, Oct. 26
Crandon Park,
Key Biscayne, FL
(800) 610-NAAR

Broward County
Sunday, Nov. 10,
C.B. Smith Park,
Pembroke Pines, FL
(800) 610-NAAR

West Palm Beach
Sunday, November 17
John Prince Park,
Lake Worth, FL
(800) 610-NAAR

WALK F.A.R. for NAAR is also scheduled to return to the following cities in Spring 2003:

- Washington, D.C.
- Rochester, NY
- Los Angeles, CA

For more information on any WALK events or about starting a WALK event in your community, call (888) 777-NAAR.

Discover
New England Village, Inc.

"A community rich with opportunity, sharing and growth"

Established as a non-profit corporation in 1972, New England Village is a warm, caring stable and secure environment where young adults with mental retardation can lead a high quality lifestyle with opportunities for growth and friendship.

Our campus, set on 80 beautifully wooded acres just 25 miles south of Boston, offers attractive contemporary style homes and townhouse apartments. Learn about our full range of residential options, extensive vocational and education programs, and wide spectrum of recreation and social opportunities. We invite you to meet our dedicated and caring staff and speak to other families about our village.

Call (781) 293-5461, or write Judy Andracchio, Admissions Coordinator, to arrange your personal visit or request our brochure. We invite private and state-sponsored referrals.

FREE PRODUCT & SERVICE INFORMATION

A SPECIAL SERVICE FOR EXCEPTIONAL PARENT READERS!

This Reply Card enables you to receive FREE information about products and services seen in EXCEPTIONAL PARENT

How to use this service

1. Locate the number at the bottom of each ad or refer to the Directory of Advertisers
2. Circle the numbers on the Reply Card that correspond to the companies or products about which you would like to receive free literature
3. Fill in your name and address on the card and mail the postage paid card. You will receive free literature from each company for which you circled a number
4. If both Reply Cards have been removed from this issue, just call or write to the companies directly

Be sure to tell them you saw their ad in EXCEPTIONAL PARENT!

nonprofit groups and consider whether autism would benefit from a similar organization. She became more active in local autism organizations and began attending conferences, raising questions about the lack of autism research in the country.

Eric, a psychiatrist who had spent several years engaged in brain research, had also noticed his growing caseload of patients with autism. The Londons discussed the idea of forming an autism organization with pioneering autism researcher Dr. Margaret Bauman, who enthusiastically endorsed the idea.

The family's basement became NAAR's first office. Work was completed during the day, with the children at school, and in the evenings, after the children were asleep.

Karen and Eric persuaded 22 leaders from the nation's top universities and research centers to form the group's first Scientific Advisory Board. Karen also assembled a board of trustees by asking doctors, journalists, professors and Philadelphia Eagles owner Jeffrey Lurie to help guide the young organization. At the same time, she started to form an Honorary Board to lend their talents and resources to raising funds and awareness for autism research. Honorary board members include the likes of musicians and composers Wynton Marsalis and Branford Marsalis, actors Joe Mantegna and Aidan Quinn, and football legends Dan Marino and Doug Flutie. Most members of the board and honorary board have a family member with autism. EP

Funding Autism Research

NAAR awarded its first research grants in 1997. Since then, its continuous funding of pilot studies and collaborative research projects have played a key role in the increased funding for autism research allocated by the National Institutes of Health. The WALK F.A.R. for NAAR autism walkathons continue to spread awareness about the need for more autism research in communities across the country. (See sidebar for more information.)

The National Alliance for Autism Research was created in a spirit of optimism and excitement over the opportunities for promising research in autism. Its mission includes providing grants to researchers for new pilot studies, mentoring fellowships to recruit new researchers to focus on autism, and funding larger, collaborative research projects that have the potential to yield major scientific advances in autism research and scientific conferences. Autism studies funded by the National Alliance for Autism Research cover a wide range of areas, including:

- Genetics
- Immunology
- Epidemiological studies
- Cognition
- Molecular & Cell Biology
- Neuroanatomy & Neuroimaging
- Language & Communication
- Behavior
